AB An isolated and purified outer membrane **protein** of a Moraxella strain, particularly M. catarrhalis, having a mol. mass of about 200 kDa, is provided by recombinant means. The about 200 kDa outer membrane **protein** as well as nucleic acid mols. encoding the same are useful in diagnostic applications and immunogenic compns., particularly for in vivo administration to a

host to confer protection against disease caused by a bacterial pathogen that produces the about 200 kDa outer membrane **protein** or produces a **protein** capable of inducing **antibodies** in a host specifically reactive with the about 200 kDa outer membrane **protein**. N-terminally and C-terminally truncated about 200 kDa **proteins** also are produced recombinantly. The gene was cloned from the 4223 strain by screening an expression library in .lambda.EMBL3 with antiserum to the **protein**. A series of overlapping fragments were obtained and assembled to give the full-length gene. The gene was then used as a probe to obtain the gene from a no. of different strains of the bacterium. **Protein** manufd. in Escherichia coli was obtained as inclusion bodies that could be resolubilized and used raise antiserum in mice and guinea pigs. The antiserum was bactericidal and could block the binding of the bacterium to animal cells. Comparison of the sequences of the G tract of genes from strains with different clumping activity indicated that the no. of G's in the tract affected levels of gene expression. Prepn. and characterization of N- and C-terminal truncation derivs. is described.

AB A review with 53 refs. **Vaccine** development for **M . catarrhalis** is in the **antigen** identification stage. M. catarrhalis does not appear to synthesize secreted antigens such as exotoxins, nor does it appear to possess a carbohydrate capsule. Modified forms of these antigens are usually good vaccine components. There is some interest in whole bacterial cells and membrane fractions, but the search has largely focused on purified outer surface antigens. All of the present antigens have been selected based on the response seen in animals, although the **antibody** response seen in people exposed to the bacterium provides some guidance. The **antibody** response provides information related to the cross-strain preservation of epitopes and whether they are surface exposed. Antigens that elicit **antibodies** that have complement dependent bactericidal capacity, opsonophagocytic activity or interfere with one of the antigen's known functions such as adhesion or nutrient acquisition are particularly valued. In addn. to examg. the **antibody** response, some antigens have been evaluated in a murine pulmonary clearance model. Using these assays and model, several vaccine candidates have been identified. The antigens may be roughly classified by the function they serve the bacterium. One set appears to promote adhesion to host tissues and includes the

hemagglutinins, ubiquitous surface **protein** A1 (UspA1), and possibly the CD **protein**. A second set is involved in nutrient acquisition. This set includes the lactoferrin binding **protein** A (LbpA) and lactoferrin binding **protein** B (LbpB), the transferrin binding **protein** A (TbpA) and transferrin binding **protein** B (TbpB), the CD and E porins, and the catarrhalis outer membrane **protein** B (CopB). A third set is comprised of antigens involved in virulence and it includes lipooligosaccharide (LOS) and the ubiquitous surface **protein** A2 (UspA2). Antigens of unknown function, such as the 200 K **protein**, may also be vaccine candidates.

WO 1999-US22918 W 19991001

AB The invention discloses the Moraxella catarrhalis outer membrane **protein polypeptide** and **polypeptides** derived therefrom (collectively "OMP21"), nucleotide sequences encoding said OMP21, and **antibodies** that specifically bind OMP21. Also disclosed are pharmaceutical compns. including prophylactic or therapeutic compns., which may be immunogenic compns. including vaccines, comprising OMP21, **antibodies** thereto or nucleotides encoding same. The invention addnl. discloses methods of inducing an immune response to M. catarrhalis and OMP21 in an animal, preferably a human, methods of treating and methods of diagnosing Moraxella infections in an animal, preferably a human, and kits therefor. The outer membrane **proteins** of several strains of M. catarrhalis were extd. with non-denaturing detergents (octyl glucoside or EmpigenBB.RTM.) and fractionated on SDS-polyacrylamide gels followed by transfer to PVDF membranes for N-terminal sequencing. The **protein** was antigenic in rabbits and conserved between strains of M. catarrhalis and related bacteria. Antisera to the **protein** mediated complement killing of M. catarrhalis. The gene, omp21, was cloned by PCR with degenerate primers and a knockout mutation created. The knockout strain showed weaker binding to cultured nasopharyngeal cells than did the wild type.

AB The invention provides BASB034 **polypeptides** and polynucleotides encoding BASB034 **polypeptides** and methods for producing such **polypeptides** by recombinant techniques. It is not uncommon to isolate Moraxella catarrhalis strains that are resistant to some or all of the std. antibiotics. The gene BASB034 was isolate from Moraxella catarrhalis strain ATCC43617 and other strains. The non-coding flanking regions of the BASB034 gene were analyzed and exploited for modulation of BASB034 gene expression. Rflp patterns within this gene were found with the following restriction endonucleases: HphI, AluI, RsaI, EcoRV, and Sau3A1. A **vaccine** is described comprising the gene BASB034 **protein** and at least one other **Moraxella catarrhalis antigen**. This may be used to generate an immune response. **Antibodies** specific for this antigen are discussed in the light of Moraxella catarrhalis infection detection and treatment and diagnosis. Also provided are diagnostic, prophylactic and therapeutic uses.

AB The invention provides BASB023 **polypeptides** and polynucleotides encoding BASB023 **polypeptides** from Moraxella catarrhalis (also named Branhamella catarrhalis) and methods for producing such **polypeptides** by recombinant techniques. BASB023 antigen is related by amino acid sequence homol. to Legionella adelaidensis macrophage infectivity potentiator **polypeptide**. Since Moraxella catarrhalis is responsible for several pathologies, the main ones being otitis media in infants and children and pneumonia in elderlies, the invention provides diagnostic, prophylactic and therapeutic uses for Moraxella infection.

AB The invention provides Moraxella catarrhalis strain ATCC43617 gene BASB019 **polypeptides** and polynucleotides encoding BASB019 **polypeptides** and methods for producing such **polypeptides** by recombinant techniques. Variability within the BASB019 gene among several Moraxella catarrhalis strains was shown by RFLP anal. Also provided are diagnostic, prophylactic and therapeutic uses including prodn. of antisera to recombinant BASB019 and vaccine prodn. and immunizations. A treatment of humans for Moraxella catarrhalis disease using **antibody** directed against Basb019 **proteins** is described. Lastly, screening assays for antagonists and agonists for BASB019 are described.

AB Moraxella catarrhalis is an important cause of otitis media in children and lower respiratory tract infections in adults with chronic obstructive pulmonary disease (COPD). Outer membrane **protein** CD (OMP CD) is a 45-kDa **protein** which is a potential **vaccine antigen** to prevent infections caused by **M. catarrhalis**. Eight monoclonal **antibodies** were used to study the antigenic structure of the OMP CD mol. by assaying recombinant **peptides** corresponding to the sequence of the **protein**. This approach identified two surface-exposed epitopes, including one near the amino terminus (amino acids 25 to 44) and one in the central region of the mol. (amino acids 261 to 331). Assays with serum and sputum supernatants of adults with COPD revealed variable levels of **antibodies** to OMP CD among individuals. To det. which portions of the OMP CD mol. were recognized by human **antibodies**, three human serum samples were studied with six recombinant **peptides** which span the sequence of OMP CD. All three sera contained IgG **antibodies** which recognized exclusively the **peptide** corresponding to amino acids 203 to 260 by immunoblot assay. Adsorption expts. with whole bacteria established that some of the human **antibodies** are directed at surface-exposed epitopes on OMP CD. The authors conclude that OMP CD is a highly conserved mol. which contains at least two sep. epitopes which are exposed on the bacterial surface. While individual adults with COPD show variability in the immune response to OMP CD, a specific region of the OMP CD mol. (amino acids 203 to 260) is important as a target of the human immune response.

AB Moraxella catarrhalis-induced otitis media continues to be a significant cause of infection in young children, prompting increased efforts at identifying effective vaccine antigens. The authors have previously demonstrated that M. catarrhalis expresses specific outer membrane **proteins** (OMPs) in response to iron limitation and that this organism can utilize transferrin and lactoferrin for in vitro growth. One of these **proteins**, which binds human transferrin, is OMP B1. As the human host presents a naturally iron-limited environment, **proteins**, like OMP B1, which are expressed in response to this nutritional stress are potential vaccine antigens. In this study, the authors have developed monoclonal **antibody** (MAb) 11C6, which reacts to a surface-exposed epitope of OMP B1 expressed by M. catarrhalis 7169. This **antibody** was used to clone ompB1, and sequence anal. suggested that OMP B1 is the M. catarrhalis homolog to the transferrin binding **protein** B described for pathogenic Neisseriaceae, Haemophilus influenzae, Actinobacillus pleuropneumoniae, and M. catarrhalis. Expression of recombinant OMP B1 on the surface of Escherichia coli confers transferrin binding activity, confirming that this **protein** is likely involved in iron acquisition. In addn., ompB1 was used to construct an isogenic mutant in M. catarrhalis 7169. This mutant, termed 7169b12, was used as the control in bactericidal assays designed to det. if OMP B1 elicits protective **antibodies**. In the presence of MAb 11C6 and human complement, wild-type 7169 demonstrated a 99% decline in viability, whereas the ompB1 isogenic mutant was resistant to this bactericidal activity. Further anal. with MAb 11C6 revealed the presence of this OMP B1 epitope on 31% of the clin. isolates tested. These data suggest that OMP B1 is a potential **vaccine antigen** against **M. catarrhalis** infections.

AB The transferrin binding **protein** genes (tbpA and tbpB) from two strains of Moraxella catarrhalis have been cloned and sequenced. The genomic organization of the M. catarrhalis transferrin binding **protein** genes is unique among known bacteria in that tbpA precedes tbpB and there is a third gene located between them. The deduced sequences of the M. catarrhalis TbpA **proteins** from two strains were 98% identical, while those of the TbpB **proteins** from the same strains were 63% identical and 70% similar. The third gene, tentatively called orf3, encodes a **protein** of approx. 58 kDa that is 98% identical between the two strains. The tbpB genes from four addnl. strains of M. catarrhalis were cloned and sequenced, and two potential families of TbpB **proteins** were identified based on sequence similarities. Recombinant TbpA (rTbpA), rTbpB, and rORF3 **proteins** were expressed in Escherichia coli and purified. RTbpB was shown to retain its ability to bind human transferrin after transfer to a membrane, but neither rTbpA nor rORF3 did. Monospecific anti-rTbpA and anti-rTbpB **antibodies** were generated and used for immunoblot anal., which demonstrated that epitopes of M. catarrhalis TbpA and TbpB were antigenically conserved and that there was constitutive expression of the tbp genes. In the absence of an appropriate animal model, anti-rTbpA and anti-rTbpB **antibodies** were tested for their bactericidal activities. The anti-rTbpA antiserum was not bactericidal, but anti-rTbpB antisera were found to kill heterologous strains within the same family. Thus, if bactericidal ability is clin. relevant, a **vaccine** comprising multiple rTbpB **antigens** may protect against **M. catarrhalis** disease.

AB Outer membrane **protein** (OMP) CopB, an iron-repressible 81-kDa major OMP of Moraxella (Branhamella) catarrhalis has been a major focus of investigation. To assess CopB as a potential vaccine antigen, the authors elucidated the degree of antigenic and sequence heterogeneity in this **protein** among strains of M. catarrhalis. Two monoclonal **antibodies**, 1F5 and 2.9F, which bind to surface-exposed epitopes on CopB recognized 60 and 70% of the strains, resp. The degree of sequence heterogeneity in CopB was assessed by cloning and sequencing the CopB gene from two different strains of M. catarrhalis and comparing with the published sequence. There was 92 to 96% homol. between the sequences at the nucleotide level and 90 to 95% homol. at the amino acid level. The variability in the **protein** sequence is confined mainly to three moderately variable regions. Restriction fragment length polymorphism (RFLP) anal. of the CopB genes obtained from 20 diverse strains by PCR was performed. Ninety percent of the potential restriction sites in the const. regions and 47% of the potential restriction sites in the variable regions were present in the 20 strains, indicating that the pattern of variable and const. areas in the CopB gene is a general pattern among strains of M. catarrhalis. The authors conclude that the CopB gene is largely conserved among strains of M. catarrhalis and contains discrete regions which show moderate heterogeneity among strains.

AB The major outer membrane **protein** of Moraxella (Branhamella) catarrhalis, CD, was detergent-extd. from the bacterial cell wall and purified to homogeneity in high yields by a simple process. The purified **protein** appeared to exhibit immunogenic properties similar to those of native CD exposed on the surface of the bacterium. **Antibodies** to CD raised in mice specifically bound to intact B. catarrhalis, as detd. by flow cytometry anal. The IgG subclass distributions of anti-CD **antibodies** in sera from mice immunized with purified CD or with B. catarrhalis were also similar. CD was found to be antigenically conserved among a panel of B. catarrhalis isolates, as demonstrated by the consistent reactivities of mouse anti-CD antisera with a common 60 kDa **protein** on immunoblots. Furthermore, convalescent sera collected from patients with otitis media due to B. catarrhalis infection were found to be reactive with the CD **protein** by immunoblotting. Finally, the purified **protein** induced **antibodies** in guinea pigs and mice that exhibited in vitro bactericidal activity against the pathogen. Therefore, the native CD outer membrane **protein** represents a potentially useful antigen for inclusion in a vaccine against B. catarrhalis.

AB Selected antigenic **proteins** obtained from the outer membranes of M. catarrhalis are disclosed. These outer membrane **proteins** (OMPs) have mol. wts. of approx. 30 kDa, 80 kDa, and 200-700 kDa, resp. Studies demonstrated that monoclonal **antibodies** (MAbs) directed against these **proteins** confer a protective effect against infection by M. catarrhalis in animal models, demonstrating the potential usefulness of such **antibodies** in conferring passive immunity as well as the potential use of the OMPs (or variants thereof) in the prepn. of vaccines. DNA segments encoding the OMPs, methods for prepg. the antigens, and diagnostic methods are also disclosed. OMP isolation, anti-OMP MAb prodn., and cloning of genes for the OMPs are described.

AB Host bacteria carrying deletions in the purA gene (for adenylosuccinate synthetase) are used as hosts for cloning vectors carrying the purA gene as a selectable marker. The vector is stabilized by selection and the purA gene also acts as a site for integration of the plasmid. The use of these vectors does not involve the use of antibiotic resistance markers and is therefore particularly suitable for hosts used in live vaccines. A pUC8-based plasmid carrying the Escherichia coli purA gene and the gene for the nontoxic subunit of the E. coli heat-labile enterotoxin was constructed and introduced into Salmonella dublin, S. typhimurium or Salmonella vaccine strains carrying deletions in the purA gene and transformants selected on minimal medium. This plasmid was maintained in cultures grown on a minimal medium without loss for 80 generations but lost rapidly in the absence of selection (1% retention in 40 generations). When the purA gene was used in integrating vectors the prototrophic phenotype was 100% stable for at least 80 generations in the presence or absence of selection.

AB **Vaccine** development for **Moraxella catarrhalis** is in the **antigen** identification stage. **M. catarrhalis** does not appear to synthesize secreted antigens such as exotoxins, nor does it appear to possess a carbohydrate capsule. Modified forms of these antigens are usually good **vaccine** components. There is some interest in whole bacterial cells and membrane fractions, but the search has largely focused on purified outer surface antigens. All of the present antigens have been selected based on the response

seen in animals, although the **antibody** response seen in people exposed to the bacterium provides some guidance. The **antibody** response provides information related to the cross-strain preservation of epitopes and whether they are surface exposed. Antigens that elicit **antibodies** that have complement dependent bactericidal capacity, opsonophagocytic activity or interfere with one of the antigen's known functions such as adhesion or nutrient acquisition are particularly valued. In addition to examining the **antibody** response, some antigens have been evaluated in a murine pulmonary clearance model. Using these assays and model, several **vaccine** candidates have been identified. The antigens may be roughly classified by the function they serve the bacterium. One set appears to promote adhesion to host tissues and includes the hemagglutinins, ubiquitous surface **protein** A1 (UspA1), and possibly the CD **protein**. A second set is involved in nutrient acquisition. This set includes the lactoferrin binding **protein** A (LbpA) and lactoferrin binding **protein** B (LbpB), the transferrin binding **protein** A (TbpA) and transferrin binding **protein** B (TbpB), the CD and E porins, and the Catarrhalis outer membrane **protein** B (CopB). A third set is comprised of antigens involved in virulence and it includes lipooligosaccharide (LOS) and the ubiquitous surface **protein** A2 (UspA2). Antigens of unknown function, such as the 200K **protein**, may also be **vaccine** candidates. The antigens that are most suitable will be determined in clinical studies that are only beginning now.

AB BACKGROUND: Moraxella catarrhalis is an important cause of bacterial otitis media, and a **vaccine** to prevent this disease would be highly desirable. Analysis of the dominant **antigens** on the surface of **M. catarrhalis** recognized by the human immune response to infection might aid in such a search. Such analysis would be most informative when studied in the eventual target age group for the **vaccine**; thus we have studied the immune response to M. catarrhalis in infants with otitis media. METHODS: Eighteen infants (mean age, 9.4 months) experiencing an

episode of otitis media caused by M. catarrhalis were studied. Acute and convalescent **antibody** responses were studied by whole cell enzyme-linked immunosorbent assay (heterologous strain) and by immunoblotting of outer membrane **proteins** (OMPs). RESULTS: Specific IgG was detected in 17% of acute serum samples and in 61% of convalescent sera. A rise in specific IgG was detected in 10 of 12 (83%) children 8 months of age or older, compared with 1 of 6 (17%) in younger patients (P = 0.0128). Immunoblotting revealed **antibody** binding to several OMPs with some detectable cross-reactivity. Four dominant OMP targets were identified, corresponding to UspA, TbpB, CopB and a approximately 60-kDa **protein**. CONCLUSIONS: A combination of antigens might form the most suitable basis for a M. catarrhalis **vaccine** designed to prevent otitis media in this age group.

AB Moraxella catarrhalis is an important cause of otitis media in children and lower respiratory tract infections in adults with chronic obstructive pulmonary disease (COPD). Outer membrane **protein** CD (OMP CD) is a 45-kDa **protein** which is a potential **vaccine antigen** to prevent infections caused by **M. catarrhalis**. Eight monoclonal **antibodies** were used to study the antigenic structure of the OMP CD molecule by assaying recombinant **peptides** corresponding to the sequence of the **protein**. This approach identified two surface-exposed epitopes, including one near the amino terminus (amino acids 25 to 44) and one in the central region of the molecule (amino acids 261 to 331). Assays with serum and sputum supernatants of adults with COPD revealed variable levels of **antibodies** to OMP CD among individuals. To determine which portions of the OMP CD molecule were recognized by human **antibodies**, three human serum samples were studied with six recombinant **peptides** which span the sequence of OMP CD. All three sera contained immunoglobulin G **antibodies** which recognized exclusively the **peptide** corresponding to amino acids 203 to 260 by immunoblot assay. Adsorption experiments with whole bacteria established that some of the human **antibodies**

are directed at surface-exposed epitopes on OMP CD. We conclude that OMP CD is a highly conserved molecule which contains at least two separate epitopes which are exposed on the bacterial surface. While individual adults with COPD show variability in the immune response to OMP CD, a specific region of the OMP CD molecule (amino acids 203 to 260) is important as a target of the human immune response.

AB Moraxella catarrhalis-induced otitis media continues to be a significant cause of infection in young children, prompting increased efforts at identifying effective **vaccine antigens**. We have previously demonstrated that **M. catarrhalis** expresses specific outer membrane **proteins** (OMPs) in response to iron limitation and that this organism can utilize transferrin and lactoferrin for in vitro growth. One of these **proteins**, which binds human transferrin, is OMP B1. As the human host presents a naturally iron-limited environment, **proteins**, like OMP B1, which are expressed in response to this nutritional stress are potential **vaccine** antigens. In this study, we have developed monoclonal **antibody** (MAb) 11C6, which reacts to a surface-exposed epitope of OMP B1 expressed by M. catarrhalis 7169. This **antibody** was used to clone ompB1, and sequence analysis suggested that OMP B1 is the M. catarrhalis homologue to the transferrin binding **protein** B described for pathogenic Neisseriaceae, Haemophilus influenzae, Actinobacillus pleuropneumoniae, and M. catarrhalis. Expression of recombinant OMP B1 on the surface of Escherichia coli confers transferrin binding activity, confirming that this **protein** is likely involved in iron acquisition. In addition, ompB1 was used to construct an isogenic mutant in M. catarrhalis 7169. This mutant, termed 7169b12, was used as the control in bactericidal assays designed to determine if OMP B1 elicits protective **antibodies**. In the presence of MAb 11C6 and human complement, wild-type 7169 demonstrated a 99% decline in viability, whereas the ompB1 isogenic mutant was resistant to this bactericidal activity. Further analysis with MAb 11C6 revealed the presence of this OMP B1 epitope on 31% of the clinical isolates tested. These data suggest that OMP B1 is a

potential **vaccine antigen** against **M. catarrhalis** infections.

AB The transferrin binding **protein** genes (tbpA and tbpB) from two strains of Moraxella catarrhalis have been cloned and sequenced. The genomic organization of the M. catarrhalis transferrin binding **protein** genes is unique among known bacteria in that tbpA precedes tbpB and there is a third gene located between them. The deduced sequences of the M. catarrhalis TbpA **proteins** from two strains were 98% identical, while those of the TbpB **proteins** from the same strains were 63% identical and 70% similar. The third gene, tentatively called orf3, encodes a **protein** of approximately 58 kDa that is 98% identical between the two strains. The tbpB genes from four additional strains of M. catarrhalis were cloned and sequenced, and two potential families of TbpB **proteins** were identified based on sequence similarities. Recombinant TbpA (rTbpA), rTbpB, and rORF3 **proteins** were expressed in Escherichia coli and purified. rTbpB was shown to retain its ability to bind human transferrin after transfer to a membrane, but neither rTbpA nor rORF3 did. Monospecific anti-rTbpA and anti-rTbpB **antibodies** were generated and used for immunoblot analysis, which demonstrated that epitopes of M. catarrhalis TbpA and TbpB were antigenically conserved and that there was constitutive expression of the tbp genes. In the absence of an appropriate animal model, anti-rTbpA and anti-rTbpB **antibodies** were tested for their bactericidal activities. The anti-rTbpA antiserum was not bactericidal, but anti-rTbpB antisera were found to kill heterologous strains within the same family. Thus, if bactericidal ability is clinically relevant, a **vaccine** comprising multiple rTbpB **antigens** may protect against **M. catarrhalis** disease.

AB Since its discovery at the end of the nineteenth century, Moraxella (Branhamella) catarrhalis has undergone several changes of nomenclature and periodic changes in its perceived status as either a commensal or a pathogen. Molecular analysis based on DNA hybridisation or 16S rDNA sequence comparisons has established its phylogenetic position as a member of the Moraxellaceae and shown that it is related more closely to Acinetobacter spp. than to the genus Neisseria in which it was placed formerly. However, confusion with phenotypically similar Neisseria spp. can occur in the routine diagnostic laboratory if appropriate identification tests are not performed. M. catarrhalis is now accepted as the third commonest pathogen of the respiratory tract after Streptococcus pneumoniae and Haemophilus influenzae. It is a significant cause of otitis media and sinusitis in children and of lower respiratory tract infections in adults, especially those with underlying chest disease. Nosocomial spread of infection, especially within respiratory wards, has been reported. Invasive infection is uncommon, but analysis of reports for England and Wales between 1992 and 1995 revealed 89 cases of M. catarrhalis bacteraemia, with the peak incidence in children aged 1-2 years. Carriage rates of M. catarrhalis are high in children and in the elderly, but its role as a commensal organism has probably been overstated in the past. Approximately 90% of strains are now beta-lactamase positive and, given that the first such strain was reported in 1976, this represents a dramatic increase in frequency over the last 20 years which has not been paralleled in any other species. The BRO-1 and BRO-2 beta-lactamase enzymes of M. catarrhalis are found in other Moraxellaceae, but are not related to beta-lactamases of any other species and their origin is therefore unknown. Molecular and typing studies have shown that the M. catarrhalis species is genetically heterogeneous and these methods have aided epidemiological investigation. Studies of factors that may be related to pathogenicity have shown the existence of three serotypes of lipooligosaccharide and the presence of fimbriae and a possible capsule. Some strains are serum-resistant, probably by virtue of interference with complement action, whilst transferrin- and lactoferrin-binding **proteins** enable the organism to obtain iron from its environment. An **antibody** response in humans to various **M. catarrhalis** **antigens**, including highly conserved outer-membrane

proteins, has been demonstrated. Increased understanding of the organism's pathogenic properties and the host response to it may help to identify suitable **vaccine** targets or lead to other strategies to prevent infection. Whilst it remains, at present, the third most important respiratory pathogen, the impact of immunisation strategies for other organisms may change this position. The speed with which M. catarrhalis acquired beta-lactamase demonstrates the capacity of this organism to surprise us.

AB The major outer membrane **protein** of Moraxella (Branhamella) catarrhalis, CD, was detergent-extracted from the bacterial cell wall and purified to homogeneity in high yields by a simple process. The purified **protein** appeared to exhibit immunogenic properties similar to those of native CD exposed on the surface of the bacterium. **Antibodies** to CD raised in mice specifically bound to intact B. catarrhalis, as determined by flow cytometry analysis. The IgG subclass distributions of anti-CD **antibodies** in sera from mice immunized with purified CD or with B. catarrhalis were also similar. CD was found to be antigenically conserved among a panel of B. catarrhalis isolates, as demonstrated by the consistent reactivities of mouse anti-CD antisera with a common 60 kDa **protein** on immunoblots. Furthermore, convalescent sera collected from patients with otitis media due to B. catarrhalis infection were found to be reactive with the CD **protein** by immunoblotting. Finally, the purified **protein** induced **antibodies** in guinea pigs and mice that exhibited in vitro bactericidal activity against the pathogen. Therefore, the native CD outer membrane **protein** represents a potentially useful antigen for inclusion in a vaccine against B. catarrhalis.

AB A murine model for pulmonary clearance of Moraxella catarrhalis was used to determine whether immunization could enhance clearance of this organism from the lungs. Animals actively immunized with outer membrane vesicles of M. catarrhalis cleared an endobronchial challenge with the homologous strain more quickly than did sham-immunized control animals. Western blot analysis of both this immune mouse serum and rabbit antiserum raised against outer membrane vesicles of M. catarrhalis indicated that **antibodies** were present to both outer membrane **protein** and lipooligosaccharide antigens. Passive immunization of mice with the immune rabbit serum resulted in enhanced pulmonary clearance of both homologous and heterologous strains of M. catarrhalis, indicating the involvement of serum **antibody** in this clearance process and the existence of conserved surface **antigens** in the two different **M. catarrhalis** strains. These results suggest that this model system may be useful for the identification of **vaccine** candidates among the surface **antigens** of **M. catarrhalis**.

AB Moraxella catarrhalis is a significant cause of otitis media in

children. Lipooligosaccharide (LOS) is a major surface **antigen** of **M. catarrhalis** and a potential **vaccine** candidate. But little is known about the mucosal immune responses of detoxified LOS (dLOS)-**protein** conjugate **vaccines** and their potential roles on mucosal surfaces. In order to address these issues, BALB/c mice were immunized intranasally with a mixture of dLOS-CRM (the diphtheria toxin cross-reactive mutant **protein**) and cholera toxin (CT) as an adjuvant, dLOS plus CT, or CT only. After immunization, the animals were aerosolly challenged with M. catarrhalis strain 25238. Immunization with dLOS-CRM generated a significant increase in secreting IgA and IgG in nasal washes, bronchoalveolar lavage and saliva, and serum IgG, IgM and IgA against LOS of M. catarrhalis as detected by an enzyme-linked immunosorbent assay (ELISA). The dLOS-CRM elicited LOS-specific IgA, IgG, and IgM **antibody** -forming cells (AFCs) in different lymphoid tissues as measured by an enzyme-linked immunospot (ELISPOT) assay. LOS-specific IgA AFCs were found in the nasal passages, spleens, nasal-associated lymphoid tissues (NALT), cervical lymph nodes (CLN), lungs, and small intestines. LOS-specific IgG and IgM AFCs were only detected in the spleens, CLN, and nasal passages. Furthermore, the dLOS-CRM **vaccine** generated an 80% bacterial clearance in the nasopharynx and lungs when compared to the controls ($P<0.01$) following an aerosol challenge with the homologous strain 25238. Intriguingly, intranasal immunization with dLOS-CRM containing CT showed a higher level of bacterial clearance in both sites when compared to subcutaneous injections with dLOS-CRM plus a Ribi adjuvant. These data indicate that dLOS-CRM induces specific mucosal and systemic immunity against M. catarrhalis through intranasal immunization, and provides effective bacterial clearance in the mouse nasopharynx and lungs. Therefore, this may be an efficient route for **vaccines** to prevent otitis media and lower respiratory tract infections caused by M. catarrhalis.

SUMMARY LANGUAGE: English

AB Moraxella catarrhalis (formerly known as Branhamella catarrhalis) has emerged as a significant bacterial pathogen of humans over the past two decades. During this period, microbiological and molecular diagnostic techniques have been developed and improved for M.

catarrhalis, allowing the adequate determination and taxonomic positioning of this pathogen. Over the same period, studies have revealed its involvement in respiratory (e.g., sinusitis, otitis media, bronchitis, and pneumonia) and ocular infections in children and in laryngitis, bronchitis, and pneumonia in adults. The development of (molecular) epidemiological tools has enabled the national and international distribution of M. catarrhalis strains to be established, and has allowed the monitoring of nosocomial infections and the dynamics of carriage. Indeed, such monitoring has revealed an increasing number of .beta.-lactamase-positive M. catarrhalis isolates (now well above 90%), underscoring the pathogenic potential of this organism. Although a number of putative M. catarrhalis virulence factors have been identified and described in detail, their relationship to actual bacterial adhesion, invasion, complement resistance, etc. (and ultimately their role in infection and immunity), has been established in a only few cases. In the past 10 years, various animal models for the study of M. catarrhalis pathogenicity have been described, although not all of these models are equally suitable for the study of human infection. Techniques involving the molecular manipulation of **M. catarrhalis** genes and **antigens** are also advancing our knowledge of the host response to and pathogenesis of this bacterial species in humans, as well as providing insights into possible **vaccine** candidates. This review aims to outline our current knowledge of M. catarrhalis, an organism that has evolved from an emerging to a well-established human pathogen.

AN 2002-352536 [38] WPIDS

AB WO 200234771 A UPAB: 20020618

NOVELTY - A **protein** (I) from group B streptococcus (Streptococcus agalactiae) or group A streptococcus (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) a **protein** having 50 % or greater sequence identity to (I);

(2) a **protein** comprising a fragment of 7 or more consecutive amino acids from (S1);

(3) an **antibody** which binds (I);

(4) a nucleic acid encoding (I);

(5) a nucleic acid comprising one of 1057 sequences (S2), given in the specification;

(6) a nucleic acid comprising a fragment of 10 or more consecutive nucleotides from one of 6540 sequences (S3), given in the specification, which includes the sequences of (S2);

(7) a nucleic acid comprising a sequence complementary to one of (4) - (6);

(8) a nucleic acid comprising a sequence having 50 % or greater sequence identity to one of (4) - (7);

(9) a nucleic acid that can hybridize to (4) - (8), under high stringency conditions;

(10) a composition comprising (I), or one of (1) - (9);

(11) the use of (10) in the manufacture of a medicament for the treatment of prevention of infection or disease caused by streptococcus bacteria, particularly S. agalactiae and S. pyrogenes;

(12) treating a patient comprising administering (10);

(13) a hybrid **protein** of formula (F);

(14) a kit comprising primers for amplifying a template sequence contained within a Streptococcus nucleic acid sequence, where the kit comprises one primer complementary to the template sequence and a second primer complementary to a complement of the template sequence, and the parts of the primers which have complementarity define the termini of the template sequence to be amplified;

(15) a kit comprising two single-stranded oligonucleotides which allow amplification of a Streptococcus template nucleic acid contained in a single- or double-stranded nucleic acid (or mixture of it) where:

(a) one oligonucleotide comprises a primer sequence complementary to the template nucleic acid sequence;

(b) the second oligonucleotide comprises a primer sequence complementary to the complement of the template nucleic acid sequence;

(c) either or both oligonucleotides comprise a sequence(s) not complementary to the template nucleic acid sequence; and

(d) the primer sequences define the termini of the template sequence to be amplified;

(16) a computer readable medium containing one of 12024 sequences (S4), given in the specification;

(17) detecting Streptococcus in a biological sample comprising

contacting (4) - (9) with the sample under hybridizing conditions;
(18) determining whether a compound binds to (I), (1), or (2), comprising contacting a test compound with the **protein** and determining binding;
(19) a compound identified by (18);
(20) a composition comprising (1), (1), or (2) and one of:
(i) a **protein** antigen from Helicobacter pylori and/or Neisseria meningitidis serogroup B;
(ii) an outer-membrane vesicle (OMV) preparation from N. meningitidis serogroup B;
(iii) a saccharide antigen from N. meningitidis serogroup A, C, W135 and/or Y, or Streptococcus pneumoniae;
(iv) an antigen from hepatitis A, B, or C virus, and/or Bordetella pertussis;
(v) a diphtheria and/or tetanus antigen;
(vi) a saccharide antigen from Haemophilus influenzae B;
(vii) an antigen from N. gonorrhoeae, Chlamydia pneumoniae, C. trachomatis, and/or Porphyromonas gingivalis;
(viii) a polio and/or rabies antigen(s);
(ix) measles, mumps, and/or rubella antigens;
(x) an influenza antigen(s);
(xi) an antigen from Moraxella catarrhalis; and/or
(xii) an antigen from Staphlococcus aureus; and
(21) a composition comprising two or more proteins of (1), (1), or (2).
NH2-A-(-X-L-)n-B-COOH (F)
X = (I);
L = an optional linker amino acid sequence;
A = an optional N-terminal amino acid sequence;
B = an optional C-terminal amino acid sequence; and
n = an integer greater than 1.
ACTIVITY - Antibacterial; antiinflammatory. No suitable biological data is given.
MECHANISM OF ACTION - Gene therapy; vaccine.
USE - (I), nucleic acids encoding (I), and antibodies that bind (I) are used in the manufacture of medicaments for the treatment of prevention or infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acid encoding (I) is used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition (all claimed). The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I). Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying Streptococcus proteins.

AN 2001-244783 [25] WPIDS

AB WO 200119862 A UPAB: 20010508

NOVELTY - Isolated Moraxella catarrhalis BASB129-BASB131 **polypeptides** (I) comprising a fully defined sequence of 344 (S2), 678 (S4), 469 (S6) amino acids, respectively as given in the specification, or an isolated **polypeptide** (Ia) which has 85% identity to (S2), (S4) or (S6), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment (II), of (I) which has the same immunogenic activity as (I);

(2) an isolated polynucleotide (III), or its complementary nucleotide sequence comprising a nucleotide sequence:

(i) encoding a **polypeptide** that has 85% identity over the entire length of (S2), (S4), (S6);

(ii) that has 85% identity over the entire length of the nucleotide sequence encoding region which encodes (S2), (S4), (S6);

(iii) which has 85% identity over the entire length of a fully defined nucleotide sequence of 1035 (S1), 2037 (S3), 1410 (S5), base pairs as given in the specification;

(iv) comprising a nucleotide sequence encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (S1), (S3), (S5);

(v) encoding (S2), (S4) or (S6); or

(vi) an isolated polynucleotide comprising (S1), (S3) or (S5);

(3) an expression vector (IV), or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) preparation of (I) or (II);

(6) expressing (III) involves transforming (V) with (IV) which contains any one of the polynucleotides (III) given above and culturing (V) under suitable conditions to express (III);

(7) a vaccine composition which comprises (I) or (II);

(8) a vaccine composition which comprises (III);

(9) an **antibody** (Ab) immunospecific for (I) or (II); and

(10) a therapeutic composition comprising an **antibody** directed against (I) useful in treating humans with M.catarrhalis disease.

ACTIVITY - Antiinflammatory; auditory.

MECHANISM OF ACTION - Gene therapy; vaccine; initial physical attraction between a pathogen and a mammalian extracellular matrix **protein** inhibitor.

The biological activity of (I) was tested in mice. Groups of mice were immunized with BASB129, BASB130 and BASB131 vaccine. After the booster, the mice were challenged by bacterial suspension into the nostril under anesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed and homogenized. The log10 weighted mean number of colony forming unit (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log10 weighted mean number of CFU/lung and the standard deviations were calculated for each group. Results were analyzed statistically. Results showed that BASB129, BASB130 and BASB131 vaccine induced significant lung clearance as compared to the control group.

USE - The composition comprising (I), (II) or (III) is useful for preparation of a medicament used for generating an immune response in an animal. (I) is also useful as diagnostic reagent for M.catarrhalis which involves identifying (I), an **antibody** against (I) present within the biological sample from an animal suspected of having such an infection (claimed). Fragments of (I) are useful for producing corresponding full length **polypeptides** by **peptide** synthesis. The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB129-BASB131 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB129-BASB131 gene. The polynucleotide sequences can also be used in the discovery and development of antibacterial compounds. The encoded **protein** can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded **protein** or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The

polynucleotides are also useful as diagnostic reagents in which the mutations in the polynucleotide sequence may be detected and used to diagnose and/or prognose the infection or its stage or course. The polynucleotides may be used as components of arrays which have diagnostic and prognostic uses. **Antibodies** against (I) are useful for treating bacterial infections and to isolate or identify clones expressing (I) or (II), to purify the **polypeptides** by affinity chromatography. The polynucleotides and **polypeptides** are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1), (S3) or (S5) are used as PCR (polymerase chain reaction) primers. The polynucleotides are also useful in the diagnosis of the stage of infection and type of infection the pathogen has attained. The **polypeptides** and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian, host thus preventing the sequelae of infection. The polynucleotides encoding certain non-variable regions of bacterial cell surface **protein** are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify **protein** groups able to provoke a prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia.

NOVELTY - An isolated **polypeptide** having at least 85 % identity to a sequence (I) of 134 amino acids for a Moraxella catarrhalis BASB125 **polypeptide**, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** of sequence (I);

(2) immunogenic fragments of the **polypeptide** having the same immunogenic activity as sequence (I);

(3) an isolated polynucleotide:

(i) having 85 % identity to a polynucleotide encoding the **polypeptide**, especially 85 % identity to sequence (II) of 405 base pairs (bp) encoding sequence (I);

(ii) complementary to a polynucleotide of (i);

(iii) encoding the new **polypeptide**; and

(iv) encoding sequence (I) and obtained by screening a library under stringent conditions using sequence (II) or a fragment as a probe;

(4) vectors or recombinant live microorganisms comprising the polynucleotide;

(5) host cells comprising the vector and subcellular fragments/membranes of the host cells expressing the **polypeptide**;

(6) producing the new **polypeptide** comprising culturing the host cell of (5) to produce the **polypeptide** and recovering the **polypeptide** from the culture medium;

(7) expressing (3) comprising transforming a host cell with an expression vector of (4) and culturing the host cell to express the polynucleotide;

(8) vaccine compositions comprising the new **polypeptide** or (3);

(9) **antibodies** specific for the new **polypeptide**, or immunological fragments of (2);

(10) diagnosing a M. catarrhalis infection comprising identifying the new **polypeptide** or an **antibody** immunospecific for the **polypeptide**, present within a biological sample from an animal suspected of having the infection;

(11) preparing a medicament for generating an immune response in an animal using a composition comprising the new **polypeptide** or (3); and

(12) a therapeutic composition for treating humans with M.catarrhalis disease comprising an **antibody** against the new **polypeptide**.

ACTIVITY - Antibacterial. A sequence (II) of 405 base pairs (bp) was isolated from M. catarrhalis strain American Type Culture Collection (ATCC) 43617 by standard molecular biological techniques a sequence (I) of 134 amino acids deduced. Mice were immunized with a BASB125 vaccine or a killed whole cell (kwc) M. catarrhalis preparation, or were sham immunized. After a booster, mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed 30 minutes-24 hours after challenge and lungs removed aseptically and homogenized. Homogenates were diluted and plated onto agar plates, and log10 weighted mean number of colony forming units/lung determined by counting. BASB125 vaccine and kwc preparations induced significant lung clearance of M. catarrhalis versus controls. No experimental data is given.

MECHANISM OF ACTION - Vaccine; gene therapy.

USE - The **polypeptide**, immunogenic fragments of the **polypeptide**, fusion **proteins** of the

polypeptide, or polynucleotides encoding the **polypeptide** are used in **vaccine** compositions (claimed), optionally with another **M. catarrhalis antigen** (claimed). They can also be included in medicaments for use in generating an immune response in an animal (claimed). The **vaccines** and medicaments are useful in preventing and/or treating microbial diseases, especially diseases associated with M. catarrhalis infection in mammals (especially humans). The **polypeptides**/polynucleotides may be used to produce **antibodies**, which can be used in compositions useful therapeutically to treat humans with M. catarrhalis diseases (claimed). M. catarrhalis is a Gram-negative bacteria frequently isolated from the human upper respiratory tract and responsible for several pathologies in humans e.g. otitis media in children, pneumonia, sinusitis etc. The **polypeptides**, polynucleotides and **antibodies** are also useful diagnostically e.g. in the detection of the **polypeptides**/**antibodies** in a biological sample from an animal to diagnose M. catarrhalis infection (claimed). The diagnostic assays are useful e.g. to detect diseases, determine the stage and type of infection, determine the effect of drugs etc. The **polypeptides** and polynucleotides can also be used to detect antagonists and agonists useful e.g. in preventing, inhibiting and/or treating disease. The polynucleotides are also useful in producing hybridization probes to isolate sequences encoding BASB125 and similar sequences.

AB WO 200109339 A UPAB: 20010323
NOVELTY - Moraxella catarrhalis strain MC2931 (ATCC 43617) BASB117 **polypeptides**, both of 216 amino acids (I and II) as defined in the specification, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (P1) comprising an amino acid sequence which has at least 85%, preferably 100%, identity to (I) or (II) over their entire length;

(2) an immunogenic fragment (P2) of the **polypeptide**, in which the immunogenic activity of the fragment is substantially the same as (I) or (II);

(3) an isolated polynucleotide (N1) selected from:

(a) a nucleotide sequence encoding (I), (II), P1 or P2;

(b) an isolated polynucleotide comprising a nucleotide sequence encoding a **polypeptide** that has at least 85%, preferably 95%, identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(c) an isolated polynucleotide comprising a nucleotide sequence that has at least 85%, preferably 95%, identity to a nucleotide sequence encoding (I) or (II) over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(d) an isolated polynucleotide comprising the 648 (III) or 651 basepair (bp) sequence (IV) fully defined in the specification;

(e) an isolated polynucleotide comprising a nucleotide sequence which has at least 85%, preferably 95%, identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(f) a nucleotide sequence encoding (I) or (II) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having the sequence of (III), (IV) or its fragments;

(4) an expression vector or a recombinant live microorganism comprising N1;

(5) a host cell comprising the expression vector of (4), or a subcellular fraction or membrane of the host cell expressing P1;

(6) a process for producing (I), (II), P1 or P2 by culturing the host cell of (5);

(7) a process for expressing N1 comprising transforming a host cell with the expression vector of (4) and culturing the host cell;

(8) a vaccine compositions comprising (I), (II), P1 or P2 or

N1;

(9) an **antibody** immunospecific for (I), (II), P1 or P2;

(10) a method for diagnosing a Moraxella catarrhalis infection comprising identifying (I), (II), P1 or P2 or the **antibody** of (9) present within a biological sample from an animal suspected of having such an infection; and

(11) a therapeutic composition for treating humans with Moraxella catarrhalis disease, comprising at least one **antibody** against (I), (II), P1 or P2.

ACTIVITY - Antibacterial; ophthalmological; antiinflammatory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized with the **polypeptide** (BASB117) or with a killed whole cells (kwc) preparation of Moraxella catarrhalis or sham immunized.

After booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log10 weighted mean number of CFU/lung and the standard deviations were calculated for each group.

No results are given.

USE - The composition comprising an immunologic amount of the **polypeptide** or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The **polypeptides** may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The **polypeptides** or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the **polypeptides** or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

NOVELTY - New isolated **polypeptides**, comprising either of two 171 residue amino acid sequences (I and II) from Moraxella catarrhalis, both fully defined in the specification, or a sequence at least 85 % identical to (I) or (II), over their entire length, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polynucleotide encoding the novel **polypeptide**, comprising:

(a) a sequence encoding (I) or (II);

(b) a sequence having at least 85 % identity to the sequence encoding (I) or (II) over the entire coding region;

(c) a 516 (III) or 513 (IV) base pair sequence, fully defined in the specification;

(d) a sequence having at least 85 % identity to (III) or (IV) over their entire length;

(e) the complements of (a)-(d); or

(f) a sequence encoding (I) or (II) obtained by screening a library, under stringent conditions, with a labeled probe having (III), (IV), or fragments of (III) or (IV);

(2) an statement vector or a recombinant live microorganism comprising the polynucleotide of (1);

(3) a host cell comprising the vector of (2), or a subcellular fraction or membrane of the host cell expressing the novel **polypeptide**;

(4) a process for producing the novel **polypeptide**, comprising culturing the cell of (3) under expression conditions, and recovering the **polypeptide**;

(5) a process for expressing the polynucleotide of (1), comprising transforming a host cell with the vector of (2), and culturing the host cell for expression of the polynucleotide;

(6) vaccine compositions comprising the novel **polypeptide** or the polynucleotide of (1), and a carrier;

(7) an **antibody** immunospecific for the novel **polypeptide** or its immunological fragment;

(8) a method for diagnosing a M. catarrhalis infection, comprising identifying the novel **polypeptide** or the **antibody** present within a biological sample; and

(9) a therapeutic composition comprising at least one **antibody** against the novel **polypeptide**.

ACTIVITY - Antibacterial; antiinflammatory; auditory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized either with the **polypeptide** (BASB119) adsorbed onto AlPO4 (10 micro g BASB119 onto 100 micro g of AlPO4), with a killed whole cell (kwc) preparation of M. catarrhalis strain ATCC 43617 adsorbed onto AlPO4, or with 100 micro g AlPO4 without antigen. The mice were challenged with 5 multiply 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.41 (+/-0.2) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.58 log difference). BASB119 vaccine induced a 1.34 log difference in lung clearance, which was significantly different from the control.

USE - The composition comprising the novel **polypeptide** or polynucleotide is useful for preparing a medicament for

generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection. (All claimed). The **polypeptides** may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The **polypeptides** or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the **polypeptides** or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

NOVELTY - An isolated **polypeptide** (PP) comprising:
(a) a sequence of 250 amino acids (I) from Moraxella catarrhalis, given in the specification; or
(b) an amino acid sequence, which has at least 85% identity to (I), over the entire length of (I), is new.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
(1) an immunogenic fragment of the **polypeptide**, in which the immunogenic activity of the fragment is the same as (I);
(2) isolated polynucleotides, which encode the **polypeptides**, comprising:
(i) a nucleotide sequence encoding (PP);
(ii) a nucleotide sequence having 85% identity to the nucleotide sequence encoding (I) over the entire coding region;
(iii) a 753 base pair (bp) DNA sequence (II), given in the specification;
(iv) a nucleotide sequence having 85% identity to (II) over the entire length of (II);
(v) the complements of (i)-(iv); or
(vi) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having (II) or its fragments;
(3) an expression vector or a recombinant live microorganism comprising (2);
(4) a host cell comprising the expression vector, or a subcellular fraction or membrane of the host cell expressing (PP);
(5) producing (PP) comprising culturing (4) to produce (PP) and recovering (PP) from the culture medium;
(6) expressing (2) comprising transforming a host cell with the expression vector and culturing the host cell for expression of any of the polynucleotides;
(7) vaccine compositions comprising (PP) or (2), and a pharmaceutical carrier;
(8) an **antibody** immunospecific for (PP) or immunological fragment of (1);
(9) diagnosing a M. catarrhalis infection comprising identifying (PP) or the **antibody** of (8) present within a biological sample from an animal suspected of having such an infection;
(10) using the compositions of (7) for preparing a medicament for use in generating an immune response in an animal; and
(11) a therapeutic composition comprising the **antibody** of (8).
ACTIVITY - Antibacterial; antiinflammatory; pulmonary.
MECHANISM OF ACTION - Vaccine; gene therapy. Clinical test details are described but no results are given.

USE - A composition comprising an immunologic amount of (PP) or a polynucleotide encoding it, is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The **polypeptides** may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The **polypeptides** or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the **polypeptides** or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging diseases, and determining the response of an infectious organism to drugs.

AN 2001-159871 [16] WPIDS
AB WO 200109334 A UPAB: 20010323
NOVELTY - An isolated **polypeptide** comprising:

(a) a sequence of 386 amino acids (I) from Moraxella catarrhalis, given in the specification; or

(b) an amino acid sequence, which has 85% identity to (I), over the entire length of (I), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of the new **polypeptide**, in which the immunogenic activity of the fragment is the same as (I);

(2) isolated polynucleotides, which encode the new **polypeptide**, comprising:

(i) a nucleotide sequence encoding (a) or (b);

(ii) a nucleotide sequence that has 85% identity to the nucleotide sequence encoding (I) over the entire coding region;

(iii) a 1161 base pair (bp) DNA sequence (II), given in the specification;

(iv) a nucleotide sequence that has 85% identity to (II) over the entire length of (II);

(v) the complements of (i)-(iv); or

(vi) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having (II) or its fragments;

(3) an expression vector or a recombinant live microorganism comprising an isolated polynucleotide of (2);

(4) a host cell comprising the expression vector of (3), or a subcellular fraction or membrane of the host cell expressing the new **polypeptide**;

(5) producing the new **polypeptide** comprising culturing (4) to produce the new **polypeptide** and recovering it from the culture medium;

(6) expressing a polynucleotide of (2) comprising transforming a host cell with the expression vector of (3) and culturing the host cell for expression of any of the polynucleotides;

(7) vaccine compositions comprising the new **polypeptide** or polynucleotide of (2), and a pharmaceutical carrier;

(8) an **antibody** immunospecific for the new **polypeptide** or immunological fragment;

(9) diagnosing a M. catarrhalis infection comprising identifying the new **polypeptide** or the **antibody** of (8) present within a biological sample from an animal suspected of having such an infection; and

(10) a therapeutic composition comprising an **antibody** of (8).

ACTIVITY - Antibacterial; antiinflammatory; pulmonary.

MECHANISM OF ACTION - Vaccine; gene therapy. Groups of mice were immunized either with the **polypeptide** (BASB118) adsorbed onto AlPO4 (10 micro g BASB118 onto 100 micro g of AlPO4), with a killed whole cell (kwc) preparation of M. catarrhalis strain American type Culture Collection (ATCC) 43617 adsorbed onto AlPO4, or with 100 micro g AlPO4 without antigen. The mice were challenged with 5 multiply 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.66 (+/-0.18) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.3 log difference). BASB118 vaccine induced a 0.43 log difference in lung clearance, which was significantly different from the control.

USE - A composition comprising an immunologic amount of the new **polypeptide** or polynucleotide encoding it, is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The **polypeptide** may also be used as a prophylactic agent of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The **polypeptides** or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the new **polypeptide** or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging diseases, and determining the response of an infectious organism to drugs.

AN 2001-159869 [16] WPIDS

AB WO 200109332 A UPAB: 20010323

NOVELTY - A Moraxella catarrhalis strain MC2931 (ATCC 43617) BASB115 **polypeptide** of 199 amino acids (I) as defined in the specification, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (P1) comprising an amino acid sequence which has at least 85%, preferably 100%, identity to (I) over its entire length;

(2) an immunogenic fragment (P2) of the **polypeptide**, in which the immunogenic activity of the fragment is substantially the same as (I);

(3) an isolated polynucleotide (N1) selected from:

(a) a nucleotide sequence encoding (I), P1 or P2;

(b) an isolated polynucleotide comprising a nucleotide sequence encoding a **polypeptide** that has at least 85%, preferably 95%, identity to (I) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(c) an isolated polynucleotide comprising a nucleotide sequence that has at least 85%, preferably 95%, identity to a nucleotide sequence encoding (I) over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(d) an isolated polynucleotide comprising the 600 basepair (bp) sequence (II) fully defined in the specification;

(e) an isolated polynucleotide comprising a nucleotide sequence which has at least 85%, preferably 95%, identity to (I) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(f) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled

probe having the sequence of (II) or its fragments;

(4) an expression vector or a recombinant live microorganism comprising N1;

(5) a host cell comprising the expression vector of (4), or a subcellular fraction or membrane of the host cell expressing P1;

(6) a process for producing (I), P1 or P2 by culturing the host cell of (5);

(7) a process for expressing N1 comprising transforming a host cell with the expression vector of (4) and culturing the host cell;

(8) a vaccine compositions comprising (I), P1 or P2 or N1;

(9) an **antibody** immunospecific for (I), P1 or P2;

(10) a method for diagnosing a M. catarrhalis infection comprising identifying (I), P1 or P2 or the **antibody** of(9) present within a biological sample from an animal suspected of having such an infection; and

(11) a therapeutic composition for treating humans with M. catarrhalis disease, comprising at least one **antibody** against (I), P1 or P2.

ACTIVITY - Antibacterial; ophthalmological; antiinflammatory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized either with the **polypeptide** (BASB115) adsorbed onto AlPO4 (10 mu g BASB115 onto 100 mu g of AlPO4), with a killed whole cells (kwc) preparation of M. catarrhalis strain ATCC 43617 adsorbed onto AlPO4, or with 100 mu g AlPO4 without antigen. The mice were challenged with 5 x 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.66 (+/-0.18) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.76 log difference). BASB115 vaccine induced a 0.46 log difference in lung clearance, which was significantly different from the control.

USE - The composition comprising an immunologic amount of the **polypeptide** or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The **polypeptides** may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The **polypeptides** or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the **polypeptides** or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

AN 2001-159854 [16] WPIDS
AB WO 200109179 A UPAB: 20010323
NOVELTY - An isolated BASB114 Moraxella catarrhalis strain American Type Culture Collection No. 43617 **polypeptide** (I) comprising one of two fully defined sequences of 169 amino acids (S1/S2) as given in the specification or an amino acid sequence at least 85% identical to S1/S2, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of (I) in which the immunogenic activity is substantially the same as (I);

(2) an isolated polynucleotide (II) comprising:

(a) a (sequence at least 85% identical to a) nucleotide sequence encoding (I);

(b) a (sequence at least 85% identical to a) fully defined nucleotide sequence of 510 (S3) or 507 (S4) base pairs (bp) as given in the specification;

(c) complements of (a) or (b); or

(d) a nucleotide sequence obtainable by screening an appropriate library under stringent conditions with a labeled probe containing (fragments of) S3 or S4;

(3) an expression vector or a recombinant live microorganism (III) comprising (II);

(4) a host cell (IV) comprising (III) or a subcellular fraction or membrane of (IV) expressing (I);

(5) producing (I) comprising culturing (IV) and recovering the produced **polypeptide**;

(6) expressing (II) comprising transforming a host cell with (III) and culturing the host cell;

(7) vaccine compositions comprising (I) or (II);

(8) an **antibody** (V) immunospecific for (I) or its immunological fragment; and

(9) diagnosing a M. catarrhalis infection comprising identifying (I) or (V) present within a biological sample from an animal suspected of having such an infection.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized either with the **polypeptide** (BASB114) adsorbed onto AlPO4 (undefined) (10 micro g BASB114 onto 100 micro g of AlPO4), with a killed whole cells (kwc) preparation of M. catarrhalis strain ATCC 43617 adsorbed onto AlPO4, or with 100 micro g AlPO4 without antigen. The mice were challenged with 5 multiply 10 to the power of 5 cell forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log 10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge were calculated for each group. Sham immunized mice had 5.4 (+/-0.2) log 10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.6 log difference). BASB114 vaccine induced a 1.45 log difference in lung clearance, which was significantly different from the control.

USE - The composition comprising an immunologic amount of (I) or (II) is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (claimed). (I) may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. (II) are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderly patients, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. (I) or (II) may also be employed as research reagents and materials for discovering treatments of and diagnostics for human diseases. In particular, (I) or (II) are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

AN 2001-112459 [12] WPIDS
AB WO 200100838 A UPAB: 20010302
NOVELTY - Isolated BASB110 **polypeptides** (I) of Moraxella catarrhalis, are new. The BASB110 **polypeptide** has the 322 (P1) or another 322 (P2) amino acid sequence defined in the specification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (Ia) comprising an amino acid sequence which is at least 85%, preferably 95%, most preferably 100%, identical to the sequence, over its entire length, of P1 or P2;

(2) an immunogenic fragment (Ib) of (I) or (Ia), where the activity of the fragment is substantially the same as P1 or P2;

(3) an isolated polynucleotide (II) encoding (I), (Ia) or (Ib);

(4) an isolated polynucleotide (IIa) comprising a sequence encoding (Ia) or its complementary sequence;

(5) an isolated polynucleotide (IIb) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identity to a sequence encoding P1 or P2 over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(6) an isolated polynucleotide (IIc) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identical to the 969 (N1) or 966 (N2) nucleotides fully defined in the specification, or its complement;

(7) an isolated polynucleotide (IId) comprising a sequence encoding P1 or P2, obtainable by screening an appropriate library under stringent hybridization conditions with labeled probe having the sequence of N1 or N2;

(8) an expression vector (III) of a recombinant live microorganism, comprising (II), (IIa), (IIb), (IIc) or (IId);

(9) a host cell (IV) comprising (III), or a subcellular fraction or membrane of (IV) expressing (Ia);

(10) a process for producing (I), (Ia) or (Ib) comprising culturing (IV);

(11) a process for expressing (II), (IIa), (IIb), (IIc) or (IId), comprising transforming (IV) with (III) and culturing transformed (IV) under conditions sufficient for its expression;

(12) a vaccine composition (V) comprising (I), (Ia) or (Ib), or (II), (IIa), (IIb), (IIc) or (IId);

(13) an **antibody** (Ab1) immunospecific for (I), (Ia) or (Ib); and

(14) a method for diagnosing Moraxella catarrhalis infection, by identifying (I)-(Ib) or Ab1 present within a biological sample from an animal suspected of having such an infection.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Vaccine.

Groups of mice are immunized with BASB110 vaccine. After the booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log 10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log 10 weighted mean number of CFU/lung and the standard deviations were calculated for each group. Results were not given in the specification.

USE - The vaccine is useful for preparing a medicament for use in generating immune response in an animal (claimed). Ab1 is useful for treating humans suffering from Moraxella catarrhalis disease (claimed).

Polynucleotides encoding the BASB110 **polypeptides** have utility in diagnosis of the stage and type of infection, and also for therapeutic or prophylactic purposes, in particular genetic immunization.

AN 2001-112458 [12] WPIDS
AB WO 200100836 A UPAB: 20010302
NOVELTY - An isolated **polypeptide** (I) comprising an amino acid sequence which has 85% identity to the Moraxella catarrhalis BASB113 **polypeptide** sequence of 224 (S2) or 224 (S4) amino acids respectively as given in the specification, or has a sequence of (S2) or (S4), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment (II) of (I) which has the same immunogenic activity as (I);

(2) an isolated polynucleotide (III), or its complementary nucleotide sequence comprising a nucleotide sequence:

(i) encoding a **polypeptide** that has 85% identity over the entire length of (S2) or (S4);

(ii) that has 85% identity over the entire length of the

nucleotide sequence encoding region which encodes (S2) or (S4);

(iii) which has 85% identity over the entire length of a fully defined nucleotide sequence of 675 (S1) or 672 (S3) base pairs as given in the specification; and

(iv) comprising a nucleotide sequencing encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe with the sequence of (S1) or (S3);

(3) an expression vector (IV), or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) production of (I) comprising culturing (V) and recovering the produced **polypeptide**;

(6) expressing (III) involves transforming (V) with (IV) which contains any one of the polynucleotides given above and culturing (V) under suitable conditions to express the polynucleotides;

(7) a vaccine composition which comprises (I) or (II);

(8) a vaccine composition which comprises (III);

(9) an **antibody** (Ab) immunospecific for (I) or (II);

and

(10) therapeutic compositions comprising an **antibody** directed against (I) useful in treating humans with Moraxella catarrhalis.

ACTIVITY - Anti-inflammatory; auditory; antibacterial.

MECHANISM OF ACTION - Gene therapy; vaccine. Details of test are given but no results are stated.

USE - (I), (II) and (III) are useful for preparing a medicament useful for generating an immune response in an animal. (I) is also useful as diagnostic reagent for Moraxella catarrhalis which involves identifying (I) or an **antibody** against (I) present within the biological sample from an animal suspected of having such an infection (claimed). The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB113 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB113 gene. The polynucleotides and **polypeptides** are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1) or (S3) is used as PCR (polymerase chain reaction) primers. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded **protein** can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded **protein** or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The **polypeptides** and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian, host thus preventing the sequelae of infection. The polynucleotides encoding certain non-variable regions of bacterial cell surface **protein** are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with Moraxella catarrhalis to identify **protein** groups able to provoke a prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia.

(II) is also used for therapeutic or prophylactic purposes especially genetic immunization.

(b) that is 85% identical over the entire sequence which encodes (S2), (S4), (S6), (S8), (S10) or (S12);

(c) that is 85% identical to a fully defined nucleotide sequence of 759 (S1), 1953 (S3), 1218 (S5), 1233 (S7), 2457 (S9) or 2742 (S11) base pairs as given in the specification; and

(d) comprising a nucleotide sequencing encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (S1), (S3), (S5), (S7), (S9) or (S11);

(3) an expression vector (IV) or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) preparation of (I);

(6) expressing (III) involves transforming (V) with (IV) and culturing (V) under suitable conditions to express the polynucleotides;

(7) a vaccine composition which comprises (I), (II) or (III);

(8) an **antibody** (Ab) immunospecific for (I) or (II); and

(9) therapeutic compositions comprising an Ab directed against (I).

ACTIVITY - Anti-inflammatory; auditory. No supporting data given.

MECHANISM OF ACTION - Gene therapy; vaccine.

USE - The therapeutic composition comprising (I), an immunogenic fragment (II) of (I) or a polynucleotide (III) encoding (I) is useful for the preparation of a medicament for generating an immune response in an animal. (I) is also useful as a diagnostic reagent for Moraxella catarrhalis which involves identifying (I) or an **antibody** against (I) present within the biological sample from an animal suspected of having such an infection (claimed). The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB103-108 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB103-108 gene. The polynucleotides and **polypeptides** are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1), (S3), (S5), (S7), (S9) or (S11) are used as polymerase chain reaction (PCR) primers. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded **protein** can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded **protein** or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The **polypeptides** and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian host thus preventing the sequelae of infection. The polynucleotides encoding certain

non-variable regions of bacterial cell surface **protein** are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify **protein** groups able to provoke a prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia. (II) is also used for therapeutic or prophylactic purposes especially genetic immunization.

AN 2000-587296 [55] WPIDS
AB WO 200052042 A UPAB: 20001102
NOVELTY - New isolated BASB081 **polypeptides** comprising a

sequence of 919 amino acids (Ia), 889 amino acids (Ib), both given in the specification, or a sequence with 85 % identity (Ic) to (Ia) or (Ib), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of the new **polypeptide** in which the immunogenic activity of the fragment is substantially the same as (Ia) or (Ib);

(2) polynucleotides with DNA sequences comprising 2760 bp (IIa), 2670 bp (IIb), or a sequence with at least 85 % identity to (Ia) or (IIb) that encode (Ia) - (Ic), respectively;

(3) an expression vector or a recombinant live microorganism comprising the isolated polynucleotides;

(4) a host cell comprising the expression vector, a subcellular fraction or a membrane of the host cell expressing the isolated **polypeptide** comprising an amino acid sequence having at least 85 % identity to (Ia) or (Ib);

(5) producing the **polypeptides** comprising culturing the host cell for the production of the **polypeptide**, and recovering the **polypeptide** from the culture medium;

(6) expressing the polynucleotides comprising transforming a host cell with the expression vector, and culturing the host cell for expression of any one of the polynucleotides;

(7) vaccine compositions comprising any of the **polypeptides** or any of the polynucleotides;

(8) an **antibody** immunospecific for the **polypeptide** or the immunological fragment;

(9) diagnosing a Moraxella catarrhalis infection, by identifying any of the **polypeptides**, or an **antibody** that is immunospecific for the **polypeptide** , present within a biological sample from an animal suspected of having such an infection; and

(10) a therapeutic composition for treating humans with M. catarrhalis disease comprising an **antibody** directed against any of the **polypeptides**.

ACTIVITY - Anti-bacterial; immunostimulant; antiinflammatory. No biological data is given.

MECHANISM OF ACTION - Vaccine. No biological data is given.

USE - Compositions comprising any of the **polypeptides** or polynucleotides encoding them are useful in preparing a medicament for generating an immune response in an animal (claimed). The BASB081 polynucleotides and **polypeptides** are useful in preventing or treating bacterial infections, e.g. otitis media in infants and children, pneumonia in elderlies, sinusitis, nosocomial infections, chronic otitis media, auditive nerve damage, upper respiratory tract infection, or inflammation of the middle ear. The BASB081 polynucleotides and **polypeptides** are also useful as diagnostic reagents for diagnosing infections caused by bacteria, especially M. catarrhalis.

AN 2000-271440 [23] WPIDS

AB WO 200015802 A UPAB: 20000516
NOVELTY - Isolated BASB034 **polypeptides** from Moraxella catarrhalis are new.

DETAILED DESCRIPTION - An isolated BASB034 **polypeptide** (I) is new, and comprises an amino acid sequence which has at least 85% or 95% identity to, or is, one of the four fully defined 442 amino acid sequences given in the specification ((Ia)-(Id)).

INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of (I) in which the immunogenic activity is substantially the same as (Ia)-(Id);

(2) an isolated polynucleotide encoding (I), or a complementary nucleotide;

(3) an isolated polynucleotide which has at least 85% identity to a nucleotide encoding (I), or a complementary nucleotide;

(4) an isolated polynucleotide (II) which comprises a sequence which has at least 85% or 95% identity to over the entire length of, or is, one of the four fully defined 1329 base pair (bp) sequences given in the specification, or its complement;

(5) an isolated polynucleotide encoding (Ia)-(Id), obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (II), or its fragment;

(6) an expression vector or recombinant live microorganism comprising (II), or the polynucleotides of (2), (3), and (5);

(7) a host cell comprising the expression vector of (6), or a subcellular fraction of that cell expressing (I);

(8) producing (I), comprising culturing the host cell of (7) under conditions sufficient for the production of the **polypeptide**, and recovering the **polypeptide** from the culture medium;

(9) expressing (II) or the polynucleotides of (2), (3) or (5), comprising transforming a host cell with a vector comprising at least one of these polynucleotides, and culturing the cell under conditions sufficient for expression of the polynucleotide;

(10) a vaccine composition comprising an effective amount of (I), (II) or the polynucleotides of (2), (3) or (5);;

(11) an **antibody** immunospecific for (I), or the fragment of (1);

(12) diagnosing a Moraxella infection, comprising identifying (I), or an **antibody** that is immunospecific for (I), present within a biological sample from an animal suspected of having such an infection;

(13) use of a composition comprising an immunologically effective amount of (I) or (II) or the polynucleotides of (2), (3) or (5) in the preparation of a medicament for use in generating an immune response in an animal; and

(14) a therapeutic composition useful in treating humans with M. catarrhalis, comprising at least one **antibody** directed against (I) and a pharmaceutically acceptable carrier.

ACTIVITY - None given.

MECHANISM OF ACTION - None given.

USE - The polynucleotides and **polypeptides** may be employed as research reagents and material for the discovery of treatments and diagnostics for diseases, particularly human diseases. They are particularly used to diagnose and treat M. catarrhalis infections (claimed). They can be used for diagnosis of disease, staging of disease, or determining response of an infectious organism to drugs. The polynucleotides may be used as a

source for hybridization probes, and for screening of genetic mutations, serotype, organism or strain identification, identification of mutations in BASB034 sequences, and as components of arrays which are useful for diagnostic and prognostic purposes. The **polypeptides** can be used to produce **antibodies** . The **polypeptides** can also be used in vaccine formulations, and to identify agonists and antagonists. The **polypeptides**, **antibodies**, agonists and antagonists (which are bacteriostatic) are used for the treatment and prevention of diseases such as otitis media in infants and children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, and chronic otitis media with hearing loss. The **polypeptides**, agonists and antagonists are also used for screening of antibacterial drugs.

ADVANTAGE - The frequency of Moraxella catarrhalis infections has risen dramatically, and it is no longer common to isolate M. catarrhalis strains that are resistant to standard antibiotics. The BASB034 products of the invention can be used screen for new antibacterial compounds that may target these resistant bacteria.

AN 2000-206007 [18] WPIDS
AB WO 200009694 A UPAB: 20000412
NOVELTY - An isolated **polypeptide** comprising an amino acid sequence which has at least 85% identity to an 269 residue amino acid sequence, fully defined in the specification, corresponding to the Moraxella catarrhalis BASB023 **polypeptide**, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (I) having the 269 residue sequence;

(2) an isolated **polypeptide** (II) having a variant 269 residue amino acid sequence, fully defined in the specification;

(3) an immunogenic fragment of (I) or (II) in which the immunogenic activity of the immunogenic fragment is the same as (I);

(4) an isolated PN comprising a nucleotide sequence (NS) encoding a **polypeptide** that has at least 85% identity to (I) over its entire length, or a NS complementary to the isolated PN;

(5) an isolated PN comprising a NS that has at least 85% identity to a NS encoding a (I) over the entire coding region, or a NS complementary to the isolated PN;

(6) an isolated PN (III) which comprises a NS which has at least 85% identity to an 810 nucleotide sequence, fully defined in the specification and corresponding to a Moraxella cattarhalis BASB023 polynucleotide, over its entire length, or a NS complementary to the isolated PN;

(7) an isolated PN comprising a NS encoding (I), obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having a sequence (III) or a fragment;

(8) an isolated PN comprising a variant 810 nucleotide sequence, fully defined in the specification;

(9) an isolated PN comprising a NS encoding a **polypeptide** of sequence (II), obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having a sequence (III) or a fragment;

(10) an expression vector or recombinant live microorganism comprising an isolated PN of (4)-(9);

(11) a host cell comprising an expression vector of (10) or a subcellular fraction or a membrane of the host cell expressing an isolated **polypeptide** comprising an amino acid sequence that has at least 85% identity to an amino acid sequence (I);

(12) a process for producing the novel **polypeptide**, comprising culturing the host cell (11) under expression conditions and recovering the **polypeptide**;

(13) a process for expressing a PN of (4)-(9), comprising transforming a host cell with the expression vector comprising on of the PN and culturing under expression conditions;

(14) a vaccine composition comprising (I), (II), an immunogenic

fragment of (I) or (II), or a PN of (4)-(9), and a carrier;

(15) an **antibody** immunospecific for (I), (II)or the immunogenic fragment of (2);

(16) a method of diagnosing a Moraxella infection, comprising identifying (I), (II), the immunogenic fragment of (2) or the **antibody** of (15) in a biological sample form a suspect animal; and

(17) a therapeutic composition for treating Moraxella catarrhalis disease in humans, comprising at least one **antibody** of (15), and a carrier.

ACTIVITY - Antibacterial; Auditory; Antiinflammatory.

MECHANISM OF ACTION - Vaccine. Polyvalent antisera directed against the BASB023 **protein** were generated by vaccinating 2 rabbits with the purified recombinant BASB023 **protein**. Each animal was given a total of 3 immunizations intramuscularly (i.m.) of about 20 mu g BASB023 **protein** per injection (beginning with complete Freund's adjuvant and followed with incomplete Freund's adjuvant) at approx. 21 day intervals. Animals were bled prior to the first immunization and on days 35 and 57. Anti-BASB023 **protein** titers were measured by an enzyme linked immunosorbant assay (ELISA) using purified recombinant BASB023 **protein** (0.5 mu g/well). The titer was defined as the highest dilution at least 0.1 as calculated with the following equation: average OD of 2 test samples of antisera - the average OD of 2 test samples of buffer. The titers after 3 immunizations were above 3000.

USE - The Moraxella catarrhalis can cause diseases such as otitis melia, pneumonia, sinusitis and nosocomial infections. The **polypeptides** and PNs can be used as vaccines (claimed) to protect against infection, particularly Moraxella catarrhalis infections. The **antibodies** can be used for treating humans with Moraxella catarrhalis disease (claimed). The detection of the **polypeptides** or **antibodies** can be used for diagnosing Moraxella infection (claimed). The products can also be used for detection and drug screening.

AN 2000-116286 [10] WPIDS
AB WO 9958563 A UPAB: 20000228
NOVELTY - Novel Branhamella catarrhalis antigens are disclosed.
DETAILED DESCRIPTION - A **protein** (I) which is a B. catarrhalis antigen, and which has an apparent molecular weight of about 14-71 kDa (as determined by SDS- PAGE), is new.
INDEPENDENT CLAIMS are also included for the following:
(1) A homolog or derivative of (I).
(2) One or more antigenic fragments of (I).
(3) A nucleic acid (II) molecule comprising:
(a) a DNA sequence coding for (I), or its RNA equivalent;
(b) a sequence complementary to (a);
(c) a sequence which has substantial identity with (a) or (b);
(d) a sequence which codes for a homolog, derivative or fragment of (I).
(4) A vector comprising (II).
(5) A host cell transformed or transfected with the vector of (4).
(6) An immunogenic composition which is especially a vaccine, comprising (I), or the **proteins** of (1) or (2).
(7) The use of (I) or the **proteins** of (1) or (2) in the preparation of an immunogenic composition.
(8) An antigen composition, comprising (I) and/or the

proteins of (1) and/or (2), optionally together with at least one other B, catarrhalis antigen, or fragment thereof.

(9) An **antibody** raised against (I) or the **proteins** of (1) or (2).

(10) A method for detecting and/or diagnosing B. catarrhalis, comprising bringing into contact the **antibody** of (9), (I), the **proteins** of (1) or (2), or the antigen composition of (8) with a sample to be tested, and detecting the presence of (I).

(11) The use of (I), the **proteins** of (1) or (2), or the antigen composition of (8) in detecting and/or diagnosing B. catarrhalis.

(12) A kit for use in detecting and/or diagnosing B. catarrhalis, comprising (I), the **proteins** of (1) or (2), the antigen composition of (8) or the **antibody** of (9).

(13) The use of (I), or the **proteins** of (1) or (2) or the immunogenic composition of (8) in medicine, or for inducing an immune response in a subject.

(14) A method for the treatment or prophylaxis of respiratory infection or otitis media in a subject, comprising administering an effective amount of (I), the **proteins** of (1) or (2) or the immunogenic composition of (8).

USE - The antigens can be used to prepare vaccines and immunogenic compositions for the treatment and prophylaxis of Branhamella catarrhalisinfections, respiratory tract infections, and otitis media (claimed). **Antibodies** against the antigens can be used for diagnosis and purification of the antigens.

ADVANTAGE - A need exists for **antigens** from **Branhamella catarrhalis** to provide better and more effective **vaccines**. This need is met by the antigens of the invention.

AN 2000-062302 [05] WPIDS

AB WO 9958685 A UPAB: 20000128

NOVELTY - An isolated **polypeptide** with the Moraxella catarrhalis BASB028 **polypeptide** (I) sequence of 1726 amino acids fully defined in the specification, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (II), comprising an amino acid sequence which has 85% identity to the amino acid sequence of (I);

(2) an immunogenic fragment (III), of (I) or (II) which has the same immunogenic activity as (I);

(3) an isolated polynucleotide (IV), comprising a nucleotide sequence encoding (I);

(4) an isolated polynucleotide (V), or its complementary nucleotide sequence comprising a nucleotide sequence:

(a) encoding a **polypeptide** that has 85% identity over the entire length of (I);

(b) that has 85% identity over the entire length of the nucleotide sequence coding region which encodes (I); and

(c) which has 85% identity over the entire length of a fully defined nucleotide sequence of 5181 base pairs (1) as given in the specification;

(5) an expression vector (VI), or a recombinant live microorganism comprising (IV) or (V);

(6) a host cell (VII), or a membrane comprising (VI) which expresses (II);

(7) preparation of (I), comprising culturing host cells of (6) to produce the **polypeptide**, and recovering it from the culture medium;

(8) expression of (IV) or (V) which comprises transforming (VII) with (VI) which contains any one of the polynucleotides given above and culturing (VII) under suitable conditions to express the polynucleotides;

(9) a vaccine composition which comprises (I) or (II);

(10) a vaccine composition which comprises (IV) or (V);

(11) an **antibody** (Ab) immunospecific for (I), (II) or (III); and

(12) diagnosing a Moraxella infection by identifying (I),(II), (III) or an Ab produced against them, present in a biological

sample obtained from an animal suspected of having such infection.

ACTIVITY - Anti-inflammatory; auditory. No supporting data given.

MECHANISM OF ACTION - Vaccine The efficacy of BASB028 vaccine was analyzed by enhancement of lung clearance of M.catarrhalis in mice. Groups of 6 BALB/c mice were immunized subcutaneously with 100 mu l of vaccine corresponding to a 10 mu l dose and were boosted 2 weeks later. One week after the booster, the mice were challenged by instillation of 50 mu l of bacterial suspension into the left nostril under anesthesia and 0.8 mg ketamine. Mice were killed 4 hours after challenge and the lungs are removed aseptically an homogenized individually. The log 10 weighted mean number of CFU/lung is determined by counting the colonies grown on Mueller-Hinton agar plates after plating of 20 mu l of 5 serial dilutions of the homogenate. No results of the test were given.

USE - The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB028 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB028 gene. The polynucleotides and **polypeptides** are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (1) are used for PCR to determine whether or not the identified polynucleotides are transcribed in bacteria in infective tissue and so are helpful in the diagnosis of the stage and type of infection, the pathogen has attained. Probes comprising BASB028 nucleotide sequence can be constructed to conduct efficient screening of genetic mutations, serotype, taxonomic classification or identification. Primers with 1-4 nucleotides removed from the 5' and/or 3' end are used for amplifying BASB028 DNA and/or RNA isolated from a sample derived from an individual. The polynucleotides are used as components of high density polynucleotide arrays or grids which are useful for diagnostic and prognostic purposes. The **antibodies** directed against (I) or (IV) are employed to isolate or to identify clones expressing (I) or (IV) or to purify them. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded **protein**, for expression can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded **protein** or Shine-Delgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The **polypeptides** and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to the mammalian host. The polynucleotides encoding certain non-variable regions of bacterial cell surface **protein** are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify **protein** epitopes able to provoke a prophylactic or therapeutic immune response. The therapeutic composition comprising an immunologically effective amounts of a **polypeptide**, (I) or (II); or a polynucleotide, (IV) or (V) is useful in the preparation of a medicament for generating an immune response in an animal. A therapeutic composition comprising an Ab directed against one or two useful for treating humans with M.catarrhalis diseases (claimed) such as sinusitis, otitis media and

nosocomial infections.

NOVELTY - An isolated **polypeptide** with Moraxella catarrhalis BASB020 **polypeptide** (I),(II),(III),(IV) sequence of 280 amino acids (aa) as given in the specification, from M.catarrhalis strains MC2931, MC2912, MC2913 and MC2969, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated **polypeptide** (V), comprising an aa sequence which has 85% identity to the aa sequence of (I),(II),(III) or (IV);

(2) an immunogenic fragment (VI), of (I),(II),(III),(IV) or (V) which has the same immunogenic activity as (I),(II),(III) or (IV);

(3) an isolated polynucleotide (VII), comprising a nucleotide sequence encoding (I),(II),(III) or (IV);

(4) an isolated polynucleotide (VII), or its complementary nucleotide sequence comprising a nucleotide sequence:

(a) encoding a **polypeptide** that has 85% identity over the entire length of (I),(II),(III) or (IV);

(b) that has 85% identity over the entire length of the nucleotide sequence coding region which encodes (I),(II),(III) or (IV); and

(c) which has 85% identity over the entire length of a fully defined nucleotide sequence of 843 base pairs (1,2,3,4) as given in the specification;

(5) an expression vector (IX), or a recombinant live microorganism comprising (VII) or (VIII);

(6) a host cell (X), or a membrane comprising (IX) which expresses (V);

(7) preparation of (I),(II),(III) or (IV);

(8) expression of (VII) or (VIII) which comprises transforming (X) with (IX) which contains any one of the polynucleotides given above and culturing (X) under suitable conditions to express the polynucleotides;

(9) a vaccine composition which comprises (I),(II),(III) or (IV) or (V);

(10) a vaccine composition which comprises (VII) or (VIII);

(11) an **antibody** (Ab) immunospecific for

(I),(II),(III), (IV), (V) or (VI); and

(12) diagnosing a Moraxella infection by identifying (I),(II),(III), (IV),(V) or (VI) or an Ab produced against them, present in a biological sample obtained from an animal suspected of having such infection.

ACTIVITY - Anti-inflammatory; auditory.

MECHANISM OF ACTION - Vaccine. The efficacy of BASB020 vaccine was analyzed by enhancement of lung clearance of M.catarrhalis in mice. Groups of 6 BALB/c mice were immunized subcutaneously with 100 mu l of vaccine corresponding to a 10 mu l dose and were boosted 2 weeks later. One week after the booster, the mice were challenged by instillation of 50 mu l of bacterial suspension into the left nostril under anesthesia and 0.8 mg ketamine. Mice were killed 4 hours after challenge and the lungs are removed aseptically a homogenized individually. The log 10 weighted mean number of CFU/lung is determined by counting the colonies grown on Mueller-Hinton agar plates after plating of 20 mu l of 5 serial dilutions of the homogenate. BASB020 vaccine induced significant lung clearance as compared to the control (0.62 log difference).

USE - The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB020 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB020 gene. The polynucleotides and **polypeptides** are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (1,2,3,4) are used for PCR to determine whether or not the identified polynucleotides are transcribed in bacteria in infective tissue and so are helpful in the diagnosis of the stage and type of infection, the pathogen has attained. Probes comprising BASB020 nucleotide sequence can be constructed to conduct efficient screening of genetic mutations, serotype, taxonomic classification or identification. Primers with 1-4 nucleotides removed from the 5' and/or 3' end are used for amplifying BASB020 DNA and/or RNA isolated from a sample derived from an individual. The polynucleotides are used as components of high density polynucleotide arrays or grids which are useful for diagnostic and prognostic purposes. The **antibodies** directed against (I),(II),(III),(IV) or (VII) are employed to isolate or to identify clones expressing (I),(II),(III),(IV) or (VII) or to purify them. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded **protein** , for expression can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded **protein** or Shine-Delgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The **polypeptides** and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to the mammalian host. The polynucleotides encoding certain non-variable regions of bacterial cell surface **protein** are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify **protein** epitopes able to provoke a prophylactic or therapeutic immune response. The therapeutic composition comprising an immunologically effective amounts of a **polypeptide**, (I),(II),(III),(IV) or (V); or a

polynucleotide, (VII) or (VIII) is useful in the preparation of a medicament for generating an immune response in an animal. A therapeutic composition comprising an Ab directed against one or two useful for treating humans with M.catarrhalis diseases (claimed) such as sinusitis, otitis media and nosocomial infections.

AB WO 9955871 A UPAB: 20000128
NOVELTY - **Polypeptides** from Moraxella catarrhalis, designated BASB011, are new.
DETAILED DESCRIPTION - An isolated **polypeptide** (P1) has an amino acid (aa) sequence having at least 85% identity to one of the sequences fully defined in the specification.
INDEPENDENT CLAIMS are also include for the following:

(1) an immunogenic fragment of P1, where immunogenic activity is substantially the same as P1;

(2) an isolated polynucleotide comprising a sequence encoding P1, or its complement;

(3) an isolated polynucleotide comprising a sequence having at least 85 (preferably at least 95)% identity to a sequence encoding P1 or its complement;

(4) an isolated polynucleotide comprising a nucleotide sequence having at least 85 (preferably at least 95)% identity over its full length to one of the sequences fully defined in the specification;

(5) an expression vector or recombinant live organism comprising one of the above polynucleotides;

(6) a host cell comprising the above expression vector, or a membrane of that host cell expressing P1;

(7) producing P1, comprising culturing the above host cell under production conditions and recovering the **polypeptide** ;

(8) a **vaccine** comprising P1 or one of the above polynucleotides in combination with at least one other **Moraxella catarrhalis antigen**;

(9) diagnosing a Moraxella infection, comprising identifying P1 or an **antibody** specific for P1 in a biological sample from an animal, and

(10) a composition for treating humans with Moraxella disease, comprising at least one **antibody** directed against P1.

USE - The **polypeptide** is used to generate an immune response in an animal (claimed), particularly against a bacterial infection, e.g. a Moraxella catarrhalis infection. M. catarrhalis is present in 15% of childhood middle ear infections in the US. Molecules of the invention may also be used to prevent adhesion of bacteria to extracellular matrix **proteins** on indwelling devices or in wounds, to block bacterial adhesion between extracellular matrix **proteins** and BASB011 **proteins** that mediate tissue damage, or to block the normal progression of pathogenesis in infections initiated other than by implanting of indwelling devices or by other surgical techniques.

ADVANTAGE - None given

AN 2000-039107 [03] WPIDS

AB WO 9958682 A UPAB: 20000118

NOVELTY - Novel BASB010 polynucleotides and **polypeptides** from Moraxella catarrhalis are disclosed.

DETAILED DESCRIPTION - An isolated BASB010 **polypeptide** (I) is new, and comprises an amino acid sequence which has at least 85% or 95% identity to, or is, the 391 (Ia), 391 (Ib) or 391 (Ic) amino acid sequences given in the specification.

INDEPENDENT CLAIMS are also included for the following:

(1) An immunogenic fragment of (I) in which the immunogenic activity is substantially the same as (Ia), (Ib) or (Ic);

(2) An isolated polynucleotide encoding (I), or a complementary nucleotide;

(3) An isolated polynucleotide (II) which comprises a sequence which has at least 85% or 95% identity to over the entire length, or is, the 1176 bp (IIa), 1176 bp (IIb) or 1176 bp (IIc) sequence given in the specification, or its complement;

(4) An isolated polynucleotide encoding (Ia)-(Ic), obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (IIa), (IIb), (IIc) or a fragment thereof;

(5) An expression vector or recombinant live microorganism comprising (II), or the polynucleotides of (2) or (4);

(6) A host cell comprising the expression vector of (5), or a subcellular fraction of that cell expressing (I);

(7) A process for producing (I), comprising culturing a host cell under conditions sufficient for the production of the **polypeptide**, and recovering the **polypeptide** from the culture medium;

(8) A process for expressing (II) or the polynucleotides of (2) or (4), comprising transforming a host cell with a vector comprising at least one of these polynucleotides, and culturing the cell under

conditions sufficient for expression of the polynucleotide;

(9) A vaccine composition comprising an effective amount of (I) and a pharmaceutically acceptable carrier;

(10) A vaccine composition comprising an effective amount of (II) or the polynucleotides of (2) or (4), and a pharmaceutically acceptable carrier;

(11) An **antibody** immunospecific for (I), or the fragment of (1);

(12) A method for diagnosing a M. catarrhalis infection, comprising identifying (I), or an **antibody** that is immunospecific for (I), present within a biological sample from an animal suspected of having such an infection;

(13) Use of a composition comprising an immunologically effective amount of (I) or (II) or the polynucleotides of (2) or (4) in the preparation of a medicament for use in generating an immune response in an animal; and

(14) A therapeutic composition useful in treating humans with M. catarrhalis, comprising at least one **antibody** directed against (I) and a pharmaceutically acceptable carrier.

ACTIVITY - Anti-bacterial, immunostimulant.

MECHANISM OF ACTION - Vaccine.

USE - The polynucleotides and **polypeptides** may be employed as research reagents and material for the discovery of treatments and diagnostics for diseases, particularly human diseases. They can be used for diagnosis of disease, staging of disease, or determining response of an infectious organism to drugs. The polynucleotides may be used as a source for hybridization probes, and for screening of genetic mutations, serotype, organism or strain identification, identification of mutations in BASB013 sequences, and as components of arrays which are useful for diagnostic and prognostic purposes. The **polypeptides** can be used to produce **antibodies**. The **polypeptides** can also be used in vaccine formulations, and to identify agonists and antagonists. The **polypeptides**, **antibodies**, agonists and antagonists (which are bacteristatic) are used for the treatment and prevention of diseases such as otitis media in infants and children, pneumonia in the elderly, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in middle ear, auditive nerve damage, delayed speech learning, infection of the upper respiratory tract and inflammation of the middle ear. They are particularly used to diagnose and treat M. catarrhalis infections. The **polypeptides**, agonists and antagonists are also used for screening of antibacterial drugs.

ADVANTAGE - The frequency of Moraxella catarrhalis infections has risen dramatically, and it is no longer common to isolate M. catarrhalis strains that are resistant to standard antibiotics. The BASB010 products of the invention can be used screen for new antibacterial compounds that may target these resistant bacteria.

AB US 5993826 A UPAB: 20000925
NOVELTY - A purified Moraxella catarrhalis (also called Branhamella catarrhalis and Neisseria catarrhalis) 80 kiloDalton (kD) CopB outer membrane **protein** (I), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

(i) an antigen composition (II) prepared by:

(1) introducing a recombinant expression vector including a DNA segment encoding (I) into a recombinant host cell;

(2) culturing the host cell under suitable conditions for the expression of (I); and

(3) collecting the expressed antigen; and

(ii) a method (III) for inducing an **antibody** response to M. catarrhalis 80 kD CopB antigens in an animal, comprising administering (I).

ACTIVITY - Auditory; Respiratory active.

MECHANISM OF ACTION - **Vaccine**, administration of (I) stimulates an immune response against **M. catarrhalis antigens** in a patient.

Groups of mice were immunized with the 8B6 monoclonal **antibody**, specific for the 80 kD outer membrane **protein** of M. catarrhalis. Control mice were immunized with an irrelevant **antibody**, 2H11 which is specific for Haemophilus ducreyi. Doses of 150 micrograms were used 18 hours prior to bacterial challenge. 5 Microliter doses of bacterial suspension, containing M. catarrhalis strain 035E, were inoculated into the lungs of the mice. 6 Hours after inoculation, the mice were sacrificed and the number of bacteria remaining in the lungs

was determined. It was found that where the 2H11 **antibody** was used, 97% of the initial bacterial population remained. However, just 38% remained when the 8B6 **antibody** was used.

USE - (I) may be used to vaccinate against M. catarrhalis, a pathogen implicating in causing chronic otis media, acute maxillary sinusitis and other bronchopulmonary and lower respiratory tract infections.

AN 1998-377595 [32] WPIDS

AB WO 9828333 A UPAB: 19991122

Isolated **peptides** (I) of 7-60 amino acids (aa) that include the sequence AQQQDQH (S1) are new. Also new are: (1) antigenic composition or **vaccine** (A) containing (I) plus buffer or diluent; (2) nucleic acid (II) encoding the UspA1 and A2 **antigens** of **Moraxella catarrhalis** isolates O35E, O46E, TTA24 and TTA37; specific a sequences together with their corresponding coding nucleotide sequences are given in the specification; (3) a method of screening **peptides** for reactivity with an **antibody** (Ab) that binds UspA1 or A2; (4) isolated **peptides** (III) with at least 7 consecutive aa from UspA1 or A2, including residues within the 582-604 or 355-377 aa regions of UspA1 and A2, respectively, of O35E, or analogous regions in other isolates; (5) antigenic construct containing (III) plus buffer or diluent, and (6) antigenic construct containing an isolated 7-60 aa **peptide** that includes at least 7 aa from UspA1 or A2, acting as a carrier covalently coupled to second antigen.

USE - (A) are used to induce an immune response in mammals against M. catarrhalis ((II) can be used similarly in genetic vaccination) and (I) can be used to treat infections by M. catarrhalis (claimed) (e.g. otitis media, sinusitis, lower respiratory tract infections), and also as immunity enhancers for other bacterial, parasitic or viral antigens, to raise Ab and as immunoassay reagents for detecting specific **antibodies**. Ab are useful for passive immunisation and as immunoassay reagents. Detection of the epitopic core sequence (i.e. (S1)), by immunoassay or by PCR, is used to diagnose infection (claimed). (II) are also used to produce recombinant **proteins** and for screening for potential anti-M. catarrhalis agents, while fragments of (II) are useful as diagnostic probes or primers or to isolate variant sequences. (A) are generally administered by subcutaneous or intramuscular injection, but oral or rectal administration is also contemplated. Ab and genetic vaccines are administered by injection, topically and orally.

AB A multi-valent immunogenic composition confers protection on an immunized host against infection caused by both Haemophilus influenzae and Moraxella catarrhalis. Such composition comprises at least four antigens comprising at least one antigen from Haemophilus influenzae, and at least one antigen from Moraxella catarrhalis. Three of the antigens are adhesins. High molecular weight (HMW) proteins and Haemophilus influenzae adhesin (Hia) proteins of non-typeable Haemophilus and a 200 kDa outer membrane protein of Moraxella catarrhalis comprise the adhesin components while the other antigen is a non-proteolytic analog of Hin47 protein. Each component does not impair the immunogenicity of the others. The multi-valent immunogenic composition may be combined with DTP component vaccines, which may also include non-virulent poliovirus and PRP-T, to provide a component vaccine without impairment of the immunogenic properties of the other antigens.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention discloses the existence of two novel proteins UspA1 and UspA2, and their respective genes uspA1 and uspA2. Each protein encompasses a region that is conserved between the two proteins and comprises an epitope that is recognized by the MAb 17C7. One or more than one of these species may aggregate to form the very high molecular weight form (i.e. greater than 200 kDa) of the UspA antigen. Compositions and both diagnostic and therapeutic methods for the treatment and study of M. catarrhalis are disclosed.

AB An isolated and purified non-denatured transferrin receptor protein of a Moraxella strain, particularly M. catarrhalis, has an apparent molecular mass of about 80 to about 90 kDa, as determined by SDS-PAGE. The transferrin receptor protein or a fragment analog thereof is useful in diagnostic applications and immunogenic compositions, particularly for in vivo administration to a host to confer protection against disease caused by a strain of Moraxella. The transferrin receptor protein is isolated from strains of Moraxella catarrhalis by a procedure including extraction of agent soluble proteins of a cell mass produced by cultivating the strain under iron-starved conditions. The transferrin receptor protein is selectively solubilized from the extracted cell mass and purified.

AB Purified and isolated nucleic acid molecules are provided which encode lactoferrin receptor proteins of Moraxella, such as M. catarrhalis, or a fragment or an analog of the lactoferrin receptor protein. The nucleic acid sequence may be used to produce recombinant lactoferrin receptor proteins Lbp1, Lbp2 and ORF3 of the strain of Moraxella free of other proteins of the Moraxella strain for purposes of diagnostics and medical treatment. Furthermore, the nucleic acid molecule may be used in the diagnosis of infection.

AB An isolated and purified outer membrane protein B1, and peptides formed therefrom, of Moraxella catarrhalis are described. A method for the isolation and purification of outer membrane protein B1 from a bacterial strain that produces B1 protein, e.g. Moraxella catarrhalis, comprises growing the bacteria in culture in iron-depleted medium to enhance the expression of the B1 protein, harvesting the bacteria from the culture, extracting from the harvested bacteria a preparation substantially comprising an outer membrane protein preparation, contacting the outer membrane preparation with an affinity matrix containing immobilized transferrin wherein B1 protein binds to the transferrin, and eluting the bound B1 protein from the transferrin. Disclosed are the uses of the B1 protein as an immunogen for vaccine formulations, and as antigens in diagnostic immunoassays.

AB The present disclosure relates to Moraxella catarrhalis outer membrane vesicle (OMV) compositions, to selected antigenic proteins from the outer membranes of M. catarrhalis which have a variety of useful properties, and to monoclonal antibodies against these proteins. Particular "Outer Membrane Proteins" (OMPs) of the invention are characterized as having molecular weights of about 30 kD, 80 kD (also termed CopB protein) and between about 200 and 700 kD (HMWP antigen). Passive immunization with monoclonal antibodies directed against these proteins confers protection against homologous and heterologous Moraxella catarrhalis strains in animal models, and active immunization with outer membrane vesicles also enhances pulmonary clearance of distinct M. catarrhalis strains. This demonstrates both the utility of antibodies in conferring passive immunity and the usefulness of OMPs, or variants thereof, in the preparation of vaccines. Also disclosed are DNA segments encoding these OMPs, methods for preparing the antigens, or variants, through the application of recombinant DNA techniques, as well as diagnostic methods and related embodiments.

AB Compositions comprising outer membrane protein "E", and peptides and oligopeptides thereof, of Moraxella catarrhalis are described. Additionally, nucleotide sequences encoding the protein, peptide, or oligopeptide are disclosed, as well as recombinant vectors containing these sequences. Protein, peptide, or oligopeptide can be produced from host cell systems containing these recombinant vectors. Peptides and oligopeptides can also be chemically synthesized. Disclosed are the uses of the protein, peptides and oligopeptides as antigens in antigenic formulations for vaccine applications or for generating antisera of diagnostic or therapeutic use; and as antigens in diagnostic immunoassays. The nucleotide sequences are useful for constructing vectors for use as vaccines for insertions into attenuated bacteria in constructing a recombinant bacterial vaccine and for inserting into a viral vector in constructing a recombinant viral vaccine. Also described is the use of nucleotide sequences related to the gene encoding E as primers and/or probes in molecular diagnostic assays for the detection of M. catarrhalis.

AN 2000428046 MEDLINE
TI Enhancement of clearance of bacteria from murine lungs by immunization with detoxified lipooligosaccharide from Moraxella catarrhalis conjugated to proteins.
AU Hu W G; Chen J; Battey J F; Gu X X
SO INFECTION AND IMMUNITY, (2000 Sep) 68 (9) 4980-5.
Journal code: 0246127. ISSN: 0019-9567.
AB Moraxella catarrhalis strain 25238 detoxified lipooligosaccharide (dLOS)-protein conjugates induced a significant rise of bactericidal anti-LOS antibodies in animals. This study reports the effect of active or passive immunization with the conjugates or their antiserum on pulmonary clearance of M. catarrhalis in an aerosol challenge mouse model. Mice were injected subcutaneously with dLOS-tetanus toxoid (dLOS-TT), dLOS-high-molecular-weight proteins (dLOS-HMP) from nontypeable Haemophilus influenzae (NTHi), or nonconjugated materials in Ribi adjuvant and then challenged with M. catarrhalis strain 25238 or O35E or NTHi strain 12. Immunization with dLOS-TT or dLOS-HMP generated a significant rise of serum anti-LOS immunoglobulin G and 68% and 35 to 41% reductions of bacteria in lungs compared with the control ($P<0.01$) following challenge with homologous strain 25238 and heterologous strain O35E, respectively. Serum anti-LOS antibody levels correlated with its bactericidal titers against M. catarrhalis and bacterial CFU in lungs. Additionally, immunization with dLOS-HMP generated a 54% reduction of NTHi strain 12 compared with the control ($P<0.01$). Passive immunization with a rabbit antiserum against dLOS-TT conferred a significant reduction of strain 25238 CFU in lungs in a dose- and time-dependent pattern compared with preimmune serum-treated mice. Kinetic examination of lung tissue sections demonstrated that antiserum-treated mice initiated and offset inflammatory responses more rapidly than preimmune serum-treated mice. These data indicate that LOS antibodies (whether active or passive) play a major role in the enhancement of pulmonary clearance of different test strains of M. catarrhalis in mice. In addition, dLOS-HMP is a potential candidate for a bivalent vaccine against M.

catarrhalis and NTHi infections.

TI Otitis media: focus on antimicrobial resistance and new treatment options.
AU Hoppe H L; Johnson C E
SO AMERICAN JOURNAL OF HEALTH-SYSTEM PHARMACY, (1998 Sep 15) 55 (18) 1881-97; quiz 1932-3. Ref: 99
Journal code: 9503023. ISSN: 1079-2082.
AB Antimicrobial resistance among organisms that cause acute otitis media (AOM) and new approaches in the prevention and treatment of AOM are discussed. Organisms commonly responsible for causing AOM include Streptococcus pneumoniae, Haemophilus influenzae, and Moraxella catarrhalis. The evolution of pneumococcal resistance to penicillins, erythromycin, trimethoprim-sulfamethoxazole, and oral cephalosporins may require treatment with agents such as vancomycin or rifampin in certain patients. H. influenzae and M. catarrhalis are becoming increasingly resistant to penicillins, trimethoprim-sulfamethoxazole, oral cephalosporins, and macrolides. Mechanisms of resistance include changes in penicillin-binding proteins, production of beta-lactamase, alterations in target enzymes, and inhibition of drug access to the site of action. Because of changing resistance patterns and the limited spectra of activity of many currently available antimicrobials, new antimicrobials have been developed in the hope of improving therapy. While amoxicillin and trimethoprim-sulfamethoxazole are appropriate first-line agents, children at risk for resistant infections may be treated initially with cefuroxime axetil, cefpodoxime proxetil, cefprozil, or amoxicillin-clavulanate. After local resistance patterns, patient adherence to therapy, in vitro data, and cost factors have been weighed, other agents to consider include loracarbef, clarithromycin, azithromycin, and ceftriaxone. Along with the efforts to improve treatment, research is focusing on the prevention of otitis media with bacterial and viral vaccines. The emergence of resistant strains of organisms causing AOM has complicated its treatment.

SO ANNALS OF THE NEW YORK ACADEMY OF SCIENCES, (1997 Dec 29) 830 330-52. Ref: 121
Journal code: 7506858. ISSN: 0077-8923.
AB Considerable evidence suggests that otitis media (OM) can be prevented by systemic immunization. Building on the highly effective H. influenzae type b (Hib) conjugate vaccine technology, pneumococcal conjugate vaccines are being developed to circumvent T-independence of these antigens and provide durable immunity at a very young age. Several pneumococcal conjugate vaccines are currently in clinical testing. Potential vaccine antigens of nontypable H. influenzae (NTHi) include OMP, HMW, pili, and fimbriae. Several OMPs show extensive homology among strains, but surface, determinants of others are highly variable so that antibodies to surface epitopes of one strain will not bind to surface epitopes of another. Several M. catarrhalis OMP and HMW antigens have vaccine potential, but no functional correlates of protection have been identified, and there is no clear evidence that antibody to M. catarrhalis is associated with OM protection. Attenuated viral vaccines also hold promise of preventing childhood OM. Two clinical trials with killed influenza vaccines have shown a significant reduction in OM among vaccine recipients compared to control children during periods of high influenza disease activity in the community. Passive immunoprophylaxis also has potential for preventing OM. Human bacterial polysaccharide immune globulin was protective for pneumococcal OM in children and in the chinchilla OM model. High-dose respiratory syncytial virus-enriched immunoglobulin reduced the incidence and severity of RSV lower respiratory tract infection in high-risk children. Passive immunoprophylaxis may also be effective in children with specific immune deficiencies, such as IgG2 deficiency, and patients who fail to respond to vaccines.

TI Dendritic cells are recruited into the airway epithelium during the inflammatory response to a broad spectrum of stimuli.
AU McWilliam A S; Napoli S; Marsh A M; Pemper F L; Nelson D J; Pimm C L; Stumbles P A; Wells T N; Holt P G
SO JOURNAL OF EXPERIMENTAL MEDICINE, (1996 Dec 1) 184 (6) 2429-32.
Journal code: 2985109R. ISSN: 0022-1007.
AB A key rate-limiting step in the adaptive immune response at peripheral challenge sites is the transmission of antigen signals to T cells in regional lymph nodes. Recent evidence suggests that specialized dendritic cells (DC) fulfill this surveillance function in the resting state, but their relatively slow turnover in most peripheral tissues brings into question their effectiveness in signaling the arrival of highly pathogenic sources of antigen which require immediate mobilization of the full range of host defenses for maintenance of homeostasis. However, the present report demonstrates that recruitment of a wave of DC into the respiratory tract mucosa is a universal feature of the acute cellular response to local challenge with bacterial, viral, and soluble protein antigens. Consistent with this finding, we also demonstrate that freshly isolated respiratory mucosal DC respond in vitro to a variety of CC chemokines as well as complementary cleavage products and N-formyl-methionyl-leucine-phenylalanine. This suggests that rapid amplification of specific antigen surveillance at peripheral

challenge sites is an integral feature of the innate immune response at mucosal surfaces, and serves as an "early warning system" to alert the adaptive immune system to incoming pathogens.

TI Evaluation of purified UspA from Moraxella catarrhalis as a vaccine in a murine model after active immunization.
AU Chen D; McMichael J C; VanDerMeid K R; Hahn D; Mininni T; Cowell J; Eldridge J
SO INFECTION AND IMMUNITY, (1996 Jun) 64 (6) 1900-5.
Journal code: 0246127. ISSN: 0019-9567.
AB Moraxella catarrhalis causes otitis media, laryngitis, and respiratory infections in humans. A high-molecular-weight outer membrane protein from this bacterium named ubiquitous surface protein A (UspA) is present on all isolates. A monoclonal antibody (MAb) to UspA that recognizes a conserved epitope of this protein has been shown to promote pulmonary clearance of bacteria in passively immunized mice. In the present study, M. catarrhalis heterologous isolates were screened by dot blot with a panel of four additional MAbs specific for surface-exposed epitopes of UspA from M. catarrhalis isolate 035E. Three of the MAbs were specific for 035E, and the fourth reacted with 17 (74%) of the 23 isolates tested. Thus, UspA contains highly conserved, semiconserved, and variable surface-exposed epitopes. The UspA was purified from the 035E isolate by ion-exchange and size-exclusion chromatography, formulated with the adjuvant QS-21, and used to immunize BALB/c mice. Upon pulmonary challenge with either 035E or the heterologous isolate TTA24, significantly fewer bacteria were recovered from the lungs of immunized mice 6 h postchallenge than from control mice. The immune sera from mice or guinea pigs contained high titers of antibodies to the homologous isolate and heterologous isolates in a whole-bacterial-cell enzyme-linked immunosorbent assay. Sera against UspA, whether prepared in mice or guinea pigs, had complement-dependent bactericidal activity toward homologous and 11 heterologous M. catarrhalis isolates. These results indicate that the conserved epitopes of the UspA are highly immunogenic and elicit broadly reactive and biologically functional antibodies. UspA may offer protection against M. catarrhalis infections and is being further evaluated as a vaccine candidate.

TI Preventing otitis media.
AU Giebink G S
SO ANNALS OF OTOLOGY, RHINOLOGY, AND LARYNGOLOGY. SUPPLEMENT, (1994 May) 163 20-3. Ref: 17
Journal code: 1256156. ISSN: 0096-8056.
AB Recurrent acute otitis media (AOM) is an extremely prevalent disease in young children. Epidemiologic associations suggest that primary prevention or reduction of AOM frequency may be achieved with breast-feeding during infancy, elimination of household tobacco smoking, and use of small rather than large day-care arrangements for infants and toddlers. Secondary antimicrobial prophylaxis with amoxicillin or sulfisoxazole reduces the frequency of recurrent AOM by about 50%, but it does not appear to reduce the duration of otitis media with effusion (OME). Tympanostomy tube insertion is not as effective as amoxicillin in reducing AOM frequency in children

without OME. Adenoidectomy appears to be warranted for children who develop recurrent AOM after extrusion of tubes. Vaccines against the common bacteria and viruses causing AOM hold the greatest promise of preventing AOM and blocking the sequence of pathologic events leading to chronic OME and middle ear sequelae. The greatest progress has been made recently with pneumococcal protein conjugate vaccines, and clinical testing is in progress.

TI Effect of immunization of pulmonary clearance of Moraxella catarrhalis in an animal model.
AU Maciver I; Unhanand M; McCracken G H Jr; Hansen E J
SO JOURNAL OF INFECTIOUS DISEASES, (1993 Aug) 168 (2) 469-72.
Journal code: 0413675. ISSN: 0022-1899.
AB A murine model for pulmonary clearance of Moraxella catarrhalis was used to determine whether immunization could enhance clearance of this organism from the lungs. Animals actively immunized with outer membrane vesicles of M. catarrhalis cleared an endobronchial challenge with the homologous strain more quickly than did sham-immunized control animals. Western blot analysis of both this immune mouse serum and rabbit antiserum raised against outer membrane vesicles of M. catarrhalis indicated that antibodies were present to both outer membrane protein and lipooligosaccharide antigens. Passive immunization of mice with the immune rabbit serum resulted in enhanced pulmonary clearance of both homologous and heterologous strains of M. catarrhalis, indicating the involvement of serum antibody in this clearance process and the existence of conserved surface antigens in the two different M. catarrhalis strains. These results suggest that this model system may be useful for the identification of vaccine candidates among the surface antigens of M. catarrhalis.

TI Secretory IgA-, IgG- and C3b-coated bacteria in the nasopharynx of otitis-prone and non-otitis-prone children.
AU Stenfors L E; Raisanen S
SO ACTA OTO-LARYNGOLOGICA, (1993 Mar) 113 (2) 191-5.
Journal code: 0370354. ISSN: 0001-6489.
AB The proportions of secretory IgA (SIgA)-, IgG- and C3b-coated bacteria obtained from a well-defined area on the posterior wall of the nasopharynx (NPH) close to the Eustachian tube were determined. Samples taken from 25 otitis-prone (OP) and 25 non-otitis-prone (NOP) children with normal serum levels of IgA and IgG were evaluated using an immunofluorescence assay. Both groups harboured significantly more nasopharyngeal bacteria coated with IgG than with SIgA ($p < 0.001$). The OP children had significantly fewer SIgA-coated bacteria ($p < 0.05$) but more C3b-coated bacteria ($p < 0.01$) in the NPH than the NOP children had. No significant difference was noted between the two groups regarding IgG coating. The occurrence of Branhamella catarrhalis in the NHP was more pronounced in the OP group ($p < 0.05$). No significant differences in the occurrence of other middle ear pathogens (Streptococcus pneumoniae, Haemophilus influenzae, Staphylococcus aureus) or quantitative dominance of pathogens were noted between the two groups. Deficiency in SIgA coating of the nasopharyngeal bacteria may contribute to the otitis-prone condition.

AB WO 200119862 A UPAB: 20010508

NOVELTY - Isolated Moraxella catarrhalis BASB129-BASB131 polypeptides (I) comprising a fully defined sequence of 344 (S2), 678 (S4), 469 (S6) amino acids, respectively as given in the specification, or an isolated polypeptide (Ia) which has 85% identity to (S2), (S4) or (S6), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment (II), of (I) which has the same immunogenic activity as (I);

(2) an isolated polynucleotide (III), or its complementary nucleotide sequence comprising a nucleotide sequence:

(i) encoding a polypeptide that has 85% identity over the entire length of (S2), (S4), (S6);

(ii) that has 85% identity over the entire length of the nucleotide sequence encoding region which encodes (S2), (S4), (S6);

(iii) which has 85% identity over the entire length of a fully defined nucleotide sequence of 1035 (S1), 2037 (S3), 1410 (S5), base pairs as given in the specification;

(iv) comprising a nucleotide sequence encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (S1), (S3), (S5);

(v) encoding (S2), (S4) or (S6); or

(vi) an isolated polynucleotide comprising (S1), (S3) or (S5);

(3) an expression vector (IV), or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) preparation of (I) or (II);

(6) expressing (III) involves transforming (V) with (IV) which contains any one of the polynucleotides (III) given above and culturing (V) under suitable conditions to express (III);

(7) a vaccine composition which comprises (I) or (II);

(8) a vaccine composition which comprises (III);

(9) an antibody (Ab) immunospecific for (I) or (II); and

(10) a therapeutic composition comprising an antibody directed against (I) useful in treating humans with M.catarrhalis disease.

ACTIVITY - Antiinflammatory; auditory.

MECHANISM OF ACTION - Gene therapy; vaccine; initial physical

attraction between a pathogen and a mammalian extracellular matrix protein inhibitor.

The biological activity of (I) was tested in mice. Groups of mice were immunized with BASB129, BASB130 and BASB131 vaccine. After the booster, the mice were challenged by bacterial suspension into the nostril under anesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed and homogenized. The log10 weighted mean number of colony forming unit (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log10 weighted mean number of CFU/lung and the standard deviations were calculated for each group. Results were analyzed statistically. Results showed that BASB129, BASB130 and BASB131 vaccine induced significant lung clearance as compared to the control group.

USE - The composition comprising (I), (II) or (III) is useful for preparation of a medicament used for generating an immune response in an animal. (I) is also useful as diagnostic reagent for M.catarrhalis which involves identifying (I), an antibody against (I) present within the biological sample from an animal suspected of having such an infection (claimed). Fragments of (I) are useful for producing corresponding full length polypeptides by peptide synthesis. The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB129-BASB131 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB129-BASB131 gene. The polynucleotide sequences can also be used in the discovery and development of antibacterial compounds. The encoded protein can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded protein or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The polynucleotides are also useful as diagnostic reagents in which the mutations in the polynucleotide sequence may be detected and used to diagnose and/or prognose the infection or its stage or course. The polynucleotides may be used as components of arrays which have diagnostic and prognostic uses. Antibodies against (I) are useful for treating bacterial infections and to isolate or identify clones expressing (I) or (II), to purify the polypeptides by affinity chromatography. The polynucleotides and polypeptides are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1), (S3) or (S5) are used as PCR (polymerase chain reaction) primers. The polynucleotides are also useful in the diagnosis of the stage of infection and type of infection the pathogen has attained. The polypeptides and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian, host thus preventing the sequelae of infection. The polynucleotides encoding certain non-variable regions of bacterial cell surface protein are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify protein groups able to provoke a prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia.

AB WO 200109339 A UPAB: 20010323
NOVELTY - Moraxella catarrhalis strain MC2931 (ATCC 43617) BASB117 polypeptides, both of 216 amino acids (I and II) as defined in the specification, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide (P1) comprising an amino acid sequence which has at least 85%, preferably 100%, identity to (I) or

(II) over their entire length;

(2) an immunogenic fragment (P2) of the polypeptide, in which the immunogenic activity of the fragment is substantially the same as (I) or (II);

(3) an isolated polynucleotide (N1) selected from:

(a) a nucleotide sequence encoding (I), (II), P1 or P2;

(b) an isolated polynucleotide comprising a nucleotide sequence encoding a polypeptide that has at least 85%, preferably 95%, identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(c) an isolated polynucleotide comprising a nucleotide sequence that has at least 85%, preferably 95%, identity to a nucleotide sequence encoding (I) or (II) over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(d) an isolated polynucleotide comprising the 648 (III) or 651 basepair (bp) sequence (IV) fully defined in the specification;

(e) an isolated polynucleotide comprising a nucleotide sequence which has at least 85%, preferably 95%, identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(f) a nucleotide sequence encoding (I) or (II) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having the sequence of (III), (IV) or its fragments;

(4) an expression vector or a recombinant live microorganism comprising N1;

(5) a host cell comprising the expression vector of (4), or a subcellular fraction or membrane of the host cell expressing P1;

(6) a process for producing (I), (II), P1 or P2 by culturing the host cell of (5);

(7) a process for expressing N1 comprising transforming a host cell with the expression vector of (4) and culturing the host cell;

(8) a vaccine compositions comprising (I), (II), P1 or P2 or N1;

(9) an antibody immunospecific for (I), (II), P1 or P2;

(10) a method for diagnosing a Moraxella catarrhalis infection comprising identifying (I), (II), P1 or P2 or the antibody of (9) present within a biological sample from an animal suspected of having such an infection; and

(11) a therapeutic composition for treating humans with Moraxella catarrhalis disease, comprising at least one antibody against (I), (II), P1 or P2.

ACTIVITY - Antibacterial; ophthalmological; antiinflammatory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized with the polypeptide (BASB117) or with a killed whole cells (kwc) preparation of Moraxella catarrhalis or sham immunized.

After booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log10 weighted mean number of CFU/lung and the standard deviations were calculated for each group.

No results are given.

USE - The composition comprising an immunologic amount of the polypeptide or polynucleotide is useful for preparing a medicament

for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the polypeptides or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

AN 2001-159875 [16] WPIDS
AB WO 200109338 A UPAB: 20010323
NOVELTY - Two Moraxella catarrhalis strain MC2931 (ATCC 43617) BASB116 polypeptides, both of 98 amino acids (I and II) as defined in the specification, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide (P1) comprising an amino acid sequence which has at least 85%, preferably 100%, identity to (I) or (II) over their entire length;

(2) an immunogenic fragment (P2) of the polypeptide, in which the immunogenic activity of the fragment is substantially the same as (I) or (II);

(3) an isolated polynucleotide (N1) selected from:

(a) a nucleotide sequence encoding (I), (II), P1 or P2;

(b) an isolated polynucleotide comprising a nucleotide sequence encoding a polypeptide that has at least 85% identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(c) an isolated polynucleotide comprising a nucleotide sequence that has at least 85%, preferably 95%, identity to a nucleotide sequence encoding (I) or (II) over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(d) an isolated polynucleotide comprising the 297 (III) or 294 (IV) basepair (bp) sequence fully defined in the specification;

(e) an isolated polynucleotide comprising a nucleotide sequence which has at least 85%, preferably 95%, identity to (I) or (II) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(f) a nucleotide sequence encoding (I) or (II) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having the sequence of (III), (IV) or its fragments;

(4) an expression vector or a recombinant live microorganism comprising N1;

(5) a host cell comprising the expression vector of (4), or a subcellular fraction or membrane of the host cell expressing P1;

(6) a process for producing (I), (II), P1 or P2 by culturing the host cell of (5);

(7) a process for expressing N1 comprising transforming a host cell with the expression vector of (4) and culturing the host cell;

(8) a vaccine compositions comprising (I), (II), P1 or P2 or N1;

(9) an antibody immunospecific for (I), (II), P1 or P2;

(10) a method for diagnosing a Moraxella catarrhalis infection comprising identifying (I), (II), P1 or P2 or the antibody of (9) present within a biological sample from an animal suspected of having such an infection; and

(11) a therapeutic composition for treating humans with Moraxella catarrhalis disease, comprising at least one antibody

against (I), (II), P1 or P2.

ACTIVITY - Antibacterial; ophthalmological; antiinflammatory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized with the polypeptide (BASB116) or with a killed whole cells (kwc) preparation of Moraxella catarrhalis or sham immunized.

After booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log10 weighted mean number of CFU/lung and the standard deviations were calculated for each group.

No results are given.

USE - The composition comprising an immunologic amount of the polypeptide or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the polypeptides or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

AN 2001-159874 [16] WPIDS

AB WO 200109337 A UPAB: 20010323

NOVELTY - New isolated polypeptides, comprising either of two 111 amino acid (I) or two 328 amino acid (II) sequences from Moraxella catarrhalis, all fully defined in the specification, or an at least 85 % identical sequence over their entire length, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polynucleotide encoding the novel polypeptide, comprising:

(a) a sequence encoding the novel polypeptide;

(b) a sequence having at least 85 % identity to (a) over its entire length;

(c) a 336 (III) or 987 (IV) base pair sequence, both fully defined in the specification;

(d) a sequence at least 85 % identical to (III) or (IV) over their entire length;

(e) the complements of (a)-(d); or

(f) a sequence encoding (I) or (II) obtained by screening a library, under stringent conditions, with a labeled probe having (III), (IV), or fragments of them;

(2) a statement vector or a recombinant live microorganism, comprising the polynucleotide of (1);

(3) a host cell comprising the vector of (2), or a subcellular fraction or membrane of the host cell expressing the novel polypeptide;

(4) a process for producing the novel polypeptide, comprising culturing the host cell of (3) under expression conditions, and recovering the polypeptide;

(5) a process for expressing the polynucleotide of (1),

comprising transforming a host cell with the vector of (2), and culturing the cell for expression of the polynucleotide;

(6) a vaccine composition comprising the novel polypeptide or the polynucleotide of (1), and a carrier;

(7) an antibody immunospecific for the novel polypeptide or its immunological fragment;

(8) a method for diagnosing a M. catarrhalis infection, comprising identifying the novel polypeptide or the antibody of (7) present within a biological sample; and

(9) a therapeutic composition comprising at least one antibody against the novel polypeptide.

ACTIVITY - Antibacterial; antiinflammatory; auditory.

MECHANISM OF ACTION - Vaccine; gene therapy.

No biological data is given.

USE - The composition comprising an immunologic amount of the polypeptide or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection. (All claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the polypeptides or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs.

(7) an antibody immunospecific for the novel polypeptide or its immunological fragment;

(8) a method for diagnosing a M. catarrhalis infection, comprising identifying the novel polypeptide or the antibody present within a biological sample; and

(9) a therapeutic composition comprising at least one antibody against the novel polypeptide.

ACTIVITY - Antibacterial; antiinflammatory; auditory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized either with the polypeptide (BASB119) adsorbed onto AlPO4 (10 micro g BASB119 onto 100 micro g of AlPO4), with a killed whole cell (kwc) preparation of M. catarrhalis strain ATCC 43617 adsorbed onto AlPO4, or with 100 micro g AlPO4 without antigen. The mice were challenged with 5 multiply 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.41 (+/-0.2) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.58 log difference). BASB119 vaccine induced a 1.34 log difference in lung clearance, which was significantly different from the control.

USE - The composition comprising the novel polypeptide or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection. (All claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. AN 2001-159872 [16] WPIDS

AB WO 200109335 A UPAB: 20010323

NOVELTY - An isolated polypeptide (PP) comprising:

(a) a sequence of 250 amino acids (I) from Moraxella catarrhalis, given in the specification; or

(b) an amino acid sequence, which has at least 85% identity to (I), over the entire length of (I), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of the polypeptide, in which the immunogenic activity of the fragment is the same as (I);

(2) isolated polynucleotides, which encode the polypeptides, comprising:

(i) a nucleotide sequence encoding (PP);

(ii) a nucleotide sequence having 85% identity to the nucleotide sequence encoding (I) over the entire coding region;

(iii) a 753 base pair (bp) DNA sequence (II), given in the specification;

(iv) a nucleotide sequence having 85% identity to (II) over the entire length of (II);

(v) the complements of (i)-(iv); or

(vi) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having (II) or its fragments;

(3) an expression vector or a recombinant live microorganism

comprising (2);

(4) a host cell comprising the expression vector, or a subcellular fraction or membrane of the host cell expressing (PP);

(5) producing (PP) comprising culturing (4) to produce (PP) and recovering (PP) from the culture medium;

(6) expressing (2) comprising transforming a host cell with the expression vector and culturing the host cell for expression of any of the polynucleotides;

(7) vaccine compositions comprising (PP) or (2), and a pharmaceutical carrier;

(8) an antibody immunospecific for (PP) or immunological fragment of (1);

(9) diagnosing a M. catarrhalis infection comprising identifying (PP) or the antibody of (8) present within a biological sample from an animal suspected of having such an infection;

(10) using the compositions of (7) for preparing a medicament for use in generating an immune response in an animal; and

(11) a therapeutic composition comprising the antibody of (8).

ACTIVITY - Antibacterial; antiinflammatory; pulmonary.

MECHANISM OF ACTION - Vaccine; gene therapy. Clinical test details are described but no results are given.

USE - A composition comprising an immunologic amount of (PP) or a polynucleotide encoding it, is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the polypeptides or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging diseases, and determining the response of an infectious organism to drugs.

AN 2001-159871 [16] WPIDS

AB WO 200109334 A UPAB: 20010323

NOVELTY - An isolated polypeptide comprising:

(a) a sequence of 386 amino acids (I) from Moraxella catarrhalis, given in the specification; or

(b) an amino acid sequence, which has 85% identity to (I), over the entire length of (I), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment of the new polypeptide, in which the immunogenic activity of the fragment is the same as (I);

(2) isolated polynucleotides, which encode the new polypeptide, comprising:

(i) a nucleotide sequence encoding (a) or (b);

(ii) a nucleotide sequence that has 85% identity to the nucleotide sequence encoding (I) over the entire coding region;

(iii) a 1161 base pair (bp) DNA sequence (II), given in the specification;

(iv) a nucleotide sequence that has 85% identity to (II) over the entire length of (II);

(v) the complements of (i)-(iv); or

(vi) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having (II) or its fragments;

(3) an expression vector or a recombinant live microorganism comprising an isolated polynucleotide of (2);

(4) a host cell comprising the expression vector of (3), or a subcellular fraction or membrane of the host cell expressing the new polypeptide;

(5) producing the new polypeptide comprising culturing (4) to produce the new polypeptide and recovering it from the culture medium;

(6) expressing a polynucleotide of (2) comprising transforming a host cell with the expression vector of (3) and culturing the host cell for expression of any of the polynucleotides;

(7) vaccine compositions comprising the new polypeptide or polynucleotide of (2), and a pharmaceutical carrier;

(8) an antibody immunospecific for the new polypeptide or immunological fragment;

(9) diagnosing a M. catarrhalis infection comprising identifying the new polypeptide or the antibody of (8) present within a biological sample from an animal suspected of having such an infection; and

(10) a therapeutic composition comprising an antibody of (8).

ACTIVITY - Antibacterial; antiinflammatory; pulmonary.

MECHANISM OF ACTION - Vaccine; gene therapy. Groups of mice were immunized either with the polypeptide (BASB118) adsorbed onto AlPO4 (10 micro g BASB118 onto 100 micro g of AlPO4), with a killed whole cell (kwc) preparation of M. catarrhalis strain American type Culture Collection (ATCC) 43617 adsorbed onto AlPO4, or with 100 micro g AlPO4 without antigen. The mice were challenged with 5 multiply 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.66 (+/-0.18) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.3 log difference). BASB118 vaccine induced a 0.43 log difference in lung clearance, which was significantly different from the control.

USE - A composition comprising an immunologic amount of the new polypeptide or polynucleotide encoding it, is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The polypeptide may also be used as a prophylactic agent of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the new polypeptide or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging diseases, and determining the response of an infectious organism to drugs.

AN 2001-159869 [16] WPIDS
AB WO 200109332 A UPAB: 20010323
NOVELTY - A Moraxella catarrhalis strain MC2931 (ATCC 43617) BASB115 polypeptide of 199 amino acids (I) as defined in the specification, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide (P1) comprising an amino acid sequence which has at least 85%, preferably 100%, identity to (I) over its entire length;

(2) an immunogenic fragment (P2) of the polypeptide, in which the immunogenic activity of the fragment is substantially the same as (I);

(3) an isolated polynucleotide (N1) selected from:

(a) a nucleotide sequence encoding (I), P1 or P2;

(b) an isolated polynucleotide comprising a nucleotide sequence encoding a polypeptide that has at least 85%, preferably 95%, identity to (I) over its entire length, or a nucleotide sequence

complementary to the isolated polynucleotide;

(c) an isolated polynucleotide comprising a nucleotide sequence that has at least 85%, preferably 95%, identity to a nucleotide sequence encoding (I) over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(d) an isolated polynucleotide comprising the 600 basepair (bp) sequence (II) fully defined in the specification;

(e) an isolated polynucleotide comprising a nucleotide sequence which has at least 85%, preferably 95%, identity to (I) over its entire length, or a nucleotide sequence complementary to the isolated polynucleotide;

(f) a nucleotide sequence encoding (I) obtainable by screening an appropriate library, under stringent conditions, with a labeled probe having the sequence of (II) or its fragments;

(4) an expression vector or a recombinant live microorganism comprising N1;

(5) a host cell comprising the expression vector of (4), or a subcellular fraction or membrane of the host cell expressing P1;

(6) a process for producing (I), P1 or P2 by culturing the host cell of (5);

(7) a process for expressing N1 comprising transforming a host cell with the expression vector of (4) and culturing the host cell;

(8) a vaccine compositions comprising (I), P1 or P2 or N1;

(9) an antibody immunospecific for (I), P1 or P2;

(10) a method for diagnosing a M. catarrhalis infection comprising identifying (I), P1 or P2 or the antibody of(9) present within a biological sample from an animal suspected of having such an infection; and

(11) a therapeutic composition for treating humans with M. catarrhalis disease, comprising at least one antibody against (I), P1 or P2.

ACTIVITY - Antibacterial; ophthalmological; antiinflammatory.

MECHANISM OF ACTION - Vaccine; gene therapy.

Groups of mice were immunized either with the polypeptide (BASB115) adsorbed onto AlPO4 (10 mu g BASB115 onto 100 mu g of AlPO4), with a killed whole cells (kwc) preparation of M. catarrhalis strain ATCC 43617 adsorbed onto AlPO4, or with 100 mu g AlPO4 without antigen. The mice were challenged with 5 x 105 colony forming units (CFU) of live M. catarrhalis strain ATCC 43617 bacteria. The log10 weighted mean number of CFU/lung and the standard deviation 4 hours after challenge was calculated for each group. Sham immunized mice had 5.66 (+/-0.18) log10 CFU/lungs 4 hours after challenge. The kwc preparation induced significant lung clearance as compared to the control group (1.76 log difference). BASB115 vaccine induced a 0.46 log difference in lung clearance, which was significantly different from the control.

USE - The composition comprising an immunologic amount of the polypeptide or polynucleotide is useful for preparing a medicament for generating an immune response in an animal. The therapeutic composition is useful in treating humans with M. catarrhalis infection (all claimed). The polypeptides may also be used as prophylactic agents of bacterial infections, particularly M. catarrhalis infections in mammals, especially humans. The polynucleotides are useful in therapy or prophylaxis, particularly genetic immunization against these infections or diseases. These diseases include otitis media in infants or children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the

middle ear, infection of the upper respiratory tract, or inflammation of the middle ear. The polypeptides or polynucleotides may also be employed as research reagents and materials for discovering treatments of and diagnostics for diseases, particularly human diseases. In particular, the polypeptides or polynucleotides are useful in the discovery and development of antibacterial compounds, or for diagnosing diseases, staging of the disease, determining the response of an infectious organism to drugs. AB WO 200109331 A UPAB: 20010328

NOVELTY - An isolated polypeptide having at least 85 % identity to a sequence (I) of 134 amino acids for a Moraxella catarrhalis BASB125 polypeptide, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide of sequence (I);

(2) immunogenic fragments of the polypeptide having the same immunogenic activity as sequence (I);

(3) an isolated polynucleotide:

(i) having 85 % identity to a polynucleotide encoding the polypeptide, especially 85 % identity to sequence (II) of 405 base pairs (bp) encoding sequence (I);

(ii) complementary to a polynucleotide of (i);

(iii) encoding the new polypeptide; and

(iv) encoding sequence (I) and obtained by screening a library under stringent conditions using sequence (II) or a fragment as a probe;

(4) vectors or recombinant live microorganisms comprising the polynucleotide;

(5) host cells comprising the vector and subcellular fragments/membranes of the host cells expressing the polypeptide;

(6) producing the new polypeptide comprising culturing the host cell of (5) to produce the polypeptide and recovering the polypeptide from the culture medium;

(7) expressing (3) comprising transforming a host cell with an expression vector of (4) and culturing the host cell to express the polynucleotide;

(8) vaccine compositions comprising the new polypeptide or (3);

(9) antibodies specific for the new polypeptide, or immunological fragments of (2);

(10) diagnosing a M. catarrhalis infection comprising identifying the new polypeptide or an antibody immunospecific for the polypeptide, present within a biological sample from an animal suspected of having the infection;

(11) preparing a medicament for generating an immune response in an animal using a composition comprising the new polypeptide or (3); and

(12) a therapeutic composition for treating humans with M.catarrhalis disease comprising an antibody against the new polypeptide.

ACTIVITY - Antibacterial. A sequence (II) of 405 base pairs (bp) was isolated from M. catarrhalis strain American Type Culture Collection (ATCC) 43617 by standard molecular biological techniques a sequence (I) of 134 amino acids deduced. Mice were immunized with a BASB125 vaccine or a killed whole cell (kwc) M. catarrhalis preparation, or were sham immunized. After a booster, mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed 30 minutes-24 hours after challenge and lungs removed aseptically and homogenized. Homogenates were diluted and plated onto agar plates, and log10 weighted mean number of colony forming units/lung determined by counting. BASB125 vaccine and kwc preparations induced significant lung clearance of M. catarrhalis versus controls. No experimental data is given.

MECHANISM OF ACTION - Vaccine; gene therapy.

USE - The polypeptide, immunogenic fragments of the polypeptide, fusion proteins of the polypeptide, or polynucleotides encoding the polypeptide are used in **vaccine** compositions (claimed), optionally with another **M. catarrhalis**

antigen (claimed). They can also be included in medicaments for use in generating an immune response in an animal (claimed). The **vaccines** and medicaments are useful in preventing and/or treating microbial diseases, especially diseases associated with M. catarrhalis infection in mammals (especially humans). The polypeptides/polynucleotides may be used to produce antibodies, which can be used in compositions useful therapeutically to treat humans with M. catarrhalis diseases (claimed). M. catarrhalis is a Gram-negative bacteria frequently isolated from the human upper respiratory tract and responsible for several pathologies in humans e.g. otitis media in children, pneumonia, sinusitis etc. The polypeptides, polynucleotides and antibodies are also useful diagnostically e.g. in the detection of the polypeptides/antibodies in a biological sample from an animal to diagnose M. catarrhalis infection (claimed). The diagnostic assays are useful e.g. to detect diseases, determine the stage and type of infection, determine the effect of drugs etc. The polypeptides and polynucleotides can also be used to detect antagonists and agonists useful e.g. in preventing, inhibiting and/or treating disease. The polynucleotides are also useful in producing hybridization probes to isolate sequences encoding BASB125 and similar sequences.

AN 2001-182955 [18] WPIDS
AB WO 200109329 A UPAB: 20010402
NOVELTY - An isolated BASB126 polypeptide (I) of Moraxella catarrhalis, comprises a sequence having at least 85% identity (over the entire length) to one of the two 192 amino acids sequences given in the specification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment (II) of (I), where (II) has the same immunogenicity of (I);

(2) an isolated polynucleotide (III) encoding (I) (II);

(3) an expression vector (IV) or a recombinant live microorganism, comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of (V) expressing (I);

(5) producing (I) comprising culturing (V) and recovering the polypeptide from the culture medium;

(6) expressing (III) comprising transforming (V) with (IV) and culturing under conditions sufficient for its expression;

(7) a vaccine (VI) comprising (I), (II) or (III);

(8) an antibody (VII) immunospecific for (I) or (II);

(9) diagnosing Moraxella catarrhalis infection comprising identifying (I) or (VII) in a biological sample from an animal suspected of having such an infection; and

(10) a therapeutic composition (VIII) for treating Moraxella catarrhalis infection comprising at least one (VII).

ACTIVITY - Antibacterial; antimicrobial; auditory; antiinflammatory.

MECHANISM OF ACTION - Vaccine.

Experimental protocols are described but no results are given.

USE - (VI) is useful for preparing a medicament for use in generating immune response in an animal (claimed). (VIII) is useful for treating humans with Moraxella catarrhalis disease (claimed).

(I) and (III) are useful in the prevention, treatment and diagnosis of microbial diseases, preferably bacterial infections such as otitis media, pneumonia, sinusitis, nosocomial infections, and invasive diseases. (I) and (III) are useful as immunogens to produce antibodies, and to asses the binding of small molecule substrate and ligands in, for e.g., cells, cell-free preparations, chemical libraries and natural product mixtures. (I), (III) and (VII) are useful to configured screening methods for detecting the effect of added compounds and production of mRNA and/or polypeptides in the cells.

(III) is useful as a hybridization probe for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB126 and to isolate cDNA and genomic clones of other genes that have a high identity particularly high sequence identity, to the

BASB126 gene. (II) has utility in diagnosis of the stage and type of infection, and also for therapeutic or prophylactic purposes, in particular genetic immunization. (II) is useful as a component of polynucleotide arrays, preferably high density arrays or grid. Dwg.0/4

AN 2001-112459 [12] WPIDS
AB WO 200100838 A UPAB: 20010302
NOVELTY - Isolated BASB110 polypeptides (I) of Moraxella catarrhalis, are new. The BASB110 polypeptide has the 322 (P1) or another 322 (P2) amino acid sequence defined in the specification.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide (Ia) comprising an amino acid sequence which is at least 85%, preferably 95%, most preferably 100%, identical to the sequence, over its entire length, of P1 or P2;

(2) an immunogenic fragment (Ib) of (I) or (Ia), where the activity of the fragment is substantially the same as P1 or P2;

(3) an isolated polynucleotide (II) encoding (I), (Ia) or (Ib);

(4) an isolated polynucleotide (IIa) comprising a sequence encoding (Ia) or its complementary sequence;

(5) an isolated polynucleotide (IIb) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identity to a sequence encoding P1 or P2 over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(6) an isolated polynucleotide (IIc) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identical to the 969 (N1) or 966 (N2) nucleotides fully defined in the specification, or its complement;

(7) an isolated polynucleotide (IId) comprising a sequence encoding P1 or P2, obtainable by screening an appropriate library under stringent hybridization conditions with labeled probe having the sequence of N1 or N2;

(8) an expression vector (III) of a recombinant live microorganism, comprising (II), (IIa), (IIb), (IIc) or (IId);

(9) a host cell (IV) comprising (III), or a subcellular fraction or membrane of (IV) expressing (Ia);

(10) a process for producing (I), (Ia) or (Ib) comprising culturing (IV);

(11) a process for expressing (II), (IIa), (IIb), (IIc) or (IId), comprising transforming (IV) with (III) and culturing transformed (IV) under conditions sufficient for its expression;

(12) a vaccine composition (V) comprising (I), (Ia) or (Ib), or (II), (IIa), (IIb), (IIc) or (IId);

(13) an antibody (Ab1) immunospecific for (I), (Ia) or (Ib); and

(14) a method for diagnosing Moraxella catarrhalis infection, by identifying (I)-(Ib) or Ab1 present within a biological sample from an animal suspected of having such an infection.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Vaccine.

Groups of mice are immunized with BASB110 vaccine. After the booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log 10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log 10 weighted mean number of CFU/lung and the standard deviations were calculated for each group. Results were not given in the specification.

USE - The vaccine is useful for preparing a medicament for use in generating immune response in an animal (claimed). Ab1 is useful for treating humans suffering from Moraxella catarrhalis disease (claimed).

Polynucleotides encoding the BASB110 polypeptides have utility in diagnosis of the stage and type of infection, and also for therapeutic or prophylactic purposes, in particular genetic immunization.

AN 2001-112458 [12] WPIDS
AB WO 200100836 A UPAB: 20010302
NOVELTY - An isolated polypeptide (I) comprising an amino acid sequence which has 85% identity to the Moraxella catarrhalis BASB113 polypeptide sequence of 224 (S2) or 224 (S4) amino acids respectively as given in the specification, or has a sequence of (S2) or (S4), is new.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
(1) an immunogenic fragment (II) of (I) which has the same

immunogenic activity as (I);

(2) an isolated polynucleotide (III), or its complementary nucleotide sequence comprising a nucleotide sequence:

(i) encoding a polypeptide that has 85% identity over the entire length of (S2) or (S4);

(ii) that has 85% identity over the entire length of the nucleotide sequence encoding region which encodes (S2) or (S4);

(iii) which has 85% identity over the entire length of a fully defined nucleotide sequence of 675 (S1) or 672 (S3) base pairs as given in the specification; and

(iv) comprising a nucleotide sequencing encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe with the sequence of (S1) or (S3);

(3) an expression vector (IV), or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) production of (I) comprising culturing (V) and recovering the produced polypeptide;

(6) expressing (III) involves transforming (V) with (IV) which contains any one of the polynucleotides given above and culturing (V) under suitable conditions to express the polynucleotides;

(7) a vaccine composition which comprises (I) or (II);

(8) a vaccine composition which comprises (III);

(9) an antibody (Ab) immunospecific for (I) or (II); and

(10) therapeutic compositions comprising an antibody directed against (I) useful in treating humans with Moraxella catarrhalis.

ACTIVITY - Anti-inflammatory; auditory; antibacterial.

MECHANISM OF ACTION - Gene therapy; vaccine. Details of test are given but no results are stated.

USE - (I), (II) and (III) are useful for preparing a medicament useful for generating an immune response in an animal. (I) is also useful as diagnostic reagent for Moraxella catarrhalis which involves identifying (I) or an antibody against (I) present within the biological sample from an animal suspected of having such an infection (claimed). The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB113 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB113 gene. The polynucleotides and polypeptides are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1) or (S3) is used as PCR (polymerase chain reaction) primers. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded protein can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded protein or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The polypeptides and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian, host thus preventing the sequelae of infection. The polynucleotides encoding certain non-variable regions of bacterial cell surface protein are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with Moraxella catarrhalis to identify protein groups able to provoke a

prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia. (II) is also used for therapeutic or prophylactic purposes especially genetic immunization.

NOVELTY - Isolated BASB112 polypeptides (I) of Moraxella catarrhalis, are new. The BASB112 polypeptide has the 122 (P1) or another 122 (P2) amino acid sequence defined in the specification.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for

the following:

(1) an isolated polypeptide (Ia) comprising an amino acid sequence which is at least 85%, preferably 95%, most preferably 100%, identical to the sequence, over its entire length, of P1 or P2;

(2) an immunogenic fragment (Ib) of (I) or (Ia), where the activity of the fragment is substantially the same as P1 or P2;

(3) an isolated polynucleotide (II) encoding (I), (Ia) or (Ib);

(4) an isolated polynucleotide (IIa) comprising a sequence encoding (Ia) or its complementary sequence

(5) an isolated polynucleotide (IIb) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identity to a sequence encoding P1 or P2 over the entire coding region, or a nucleotide sequence complementary to the isolated polynucleotide;

(6) an isolated polynucleotide (IIc) comprising a sequence having at least 85%, preferably 95%, most preferably 100% identical to the 369 (N1) or 366 (N2) nucleotides fully defined in the specification, or its complement;

(7) an isolated polynucleotide (IId) comprising a sequence encoding P1 or P2, obtainable by screening an appropriate library under stringent hybridization conditions with labeled probe having the sequence of N1 or N2;

(8) an expression vector (III) of a recombinant live microorganism, comprising (II), (IIa), (IIb), (IIc) or (IId);

(9) a host cell (IV) comprising (III), or a subcellular fraction or membrane of (IV) expressing (Ia);

(10) a process for producing (I), (Ia) or (Ib) comprising culturing (IV)

(11) a process for expressing (II), (IIa), (IIb), (IIc) or (IId), comprising transforming (IV) with (III) and culturing transformed (IV) under conditions sufficient for its expression;

(12) a vaccine composition (V) comprising (I), (Ia) or (Ib), or (II), (IIa), (IIb), (IIc) or (IId);

(13) an antibody (Ab1) immunospecific for (I), (Ia) or (Ib); and

(14) a method for diagnosing Moraxella catarrhalis infection, by identifying (I)-(Ib) or Ab1 present within a biological sample from an animal suspected of having such an infection.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Vaccine.

Groups of mice are immunized with BASB112 vaccine. After the booster, the mice were challenged by instillation of bacterial suspension into the nostril under anaesthesia. Mice were killed between 30 minutes and 24 hours after challenge and the lungs were removed aseptically and homogenized individually. The log 10 weighted mean number of colony forming units (CFU)/lung was determined by counting the colonies grown on agar plates after plating of dilutions of the homogenate. The arithmetic mean of the log 10 weighted mean number of CFU/lung and the standard deviations were calculated for each group. Results were not given in the specification.

USE - The vaccine is useful for preparing a medicament for use in generating immune response in an animal (claimed). Ab1 is useful for treating humans suffering from Moraxella catarrhalis disease (claimed).

Polynucleotides encoding the BASB112 polypeptides have utility in diagnosis of the stage and type of infection, and also for therapeutic or prophylactic purposes, in particular genetic

immunization.

AB The invention provides BASB023 polypeptides and polynucleotides encoding BASB023 polypeptides from Moraxella catarrhalis (also named Branhamella catarrhalis) and methods for producing such polypeptides by recombinant techniques. BASB023 antigen is related by amino acid sequence homol. to Legionella adelaidensis macrophage infectivity potentiator polypeptide. Since Moraxella catarrhalis is responsible for several pathologies, the main ones being otitis media in infants and children and pneumonia in elderlies, the invention provides diagnostic, prophylactic and therapeutic uses for Moraxella infection.

AN 2001-025166 [03] WPIDS
AB WO 200071724 A UPAB: 20010116
NOVELTY - An isolated polypeptide (I) comprising an amino acid sequence which is at least 85% identical to the Moraxella catarrhalis BASB103-BASB108 polypeptides fully defined sequence of 252 (S2), 650 (S4), 405 (S6), 410 (S8), 818 (S10) or 913 (S12) amino acids as given in the specification, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an immunogenic fragment (II) of (I) which has the same immunogenic activity as (I);

(2) an isolated polynucleotide (III), or its complementary nucleotide sequence comprising a nucleotide sequence:

(a) encoding (I);

(b) that is 85% identical over the entire sequence which encodes (S2), (S4), (S6), (S8), (S10) or (S12);

(c) that is 85% identical to a fully defined nucleotide sequence of 759 (S1), 1953 (S3), 1218 (S5), 1233 (S7), 2457 (S9) or

2742 (S11) base pairs as given in the specification; and

(d) comprising a nucleotide sequencing encoding (I) obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (S1), (S3), (S5), (S7), (S9) or (S11);

(3) an expression vector (IV) or a recombinant live microorganism comprising (III);

(4) a host cell (V) comprising (IV), or a subcellular fraction or membrane of the host cell expressing (I);

(5) preparation of (I);

(6) expressing (III) involves transforming (V) with (IV) and culturing (V) under suitable conditions to express the polynucleotides;

(7) a vaccine composition which comprises (I), (II) or (III);

(8) an antibody (Ab) immunospecific for (I) or (II); and

(9) therapeutic compositions comprising an Ab directed against (I).

ACTIVITY - Anti-inflammatory; auditory. No supporting data given.

MECHANISM OF ACTION - Gene therapy; vaccine.

USE - The therapeutic composition comprising (I), an immunogenic fragment (II) of (I) or a polynucleotide (III) encoding (I) is useful for the preparation of a medicament for generating an immune response in an animal. (I) is also useful as a diagnostic reagent for Moraxella catarrhalis which involves identifying (I) or an antibody against (I) present within the biological sample from an animal suspected of having such an infection (claimed). The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB103-108 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB103-108 gene. The polynucleotides and polypeptides are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (S1), (S3), (S5), (S7), (S9) or (S11) are used as polymerase chain reaction (PCR) primers. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded protein can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded protein or Shine-Dalgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The polypeptides and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to mammalian host thus preventing the sequelae of infection. The polynucleotides encoding certain non-variable regions of bacterial cell surface protein are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify protein groups able to provoke a prophylactic or therapeutic immune response. The vaccine comprising (I), (II) or (III) is useful for treating Moraxella catarrhalis infections such as sinusitis, nosocomial infections, otitis media and pneumonia. (II) is also used for therapeutic or prophylactic purposes especially genetic immunization.

PRIORITY APPLN. INFO: GB 1998-10285 19980513
AN 2000-062301 [05] WPIDS
AB WO 9958684 A UPAB: 20000128
NOVELTY - An isolated polypeptide with Moraxella catarrhalis BASB020 polypeptide (I),(II),(III),(IV) sequence of 280 amino acids (aa) as given in the specification, from M.catarrhalis strains MC2931, MC2912, MC2913 and MC2969, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polypeptide (V), comprising an aa sequence which has 85% identity to the aa sequence of (I),(II),(III) or (IV);

(2) an immunogenic fragment (VI), of (I),(II),(III),(IV) or (V) which has the same immunogenic activity as (I),(II),(III) or (IV);

(3) an isolated polynucleotide (VII), comprising a nucleotide sequence encoding (I),(II),(III) or (IV);

(4) an isolated polynucleotide (VII), or its complementary nucleotide sequence comprising a nucleotide sequence:

(a) encoding a polypeptide that has 85% identity over the entire length of (I),(II),(III) or (IV);

(b) that has 85% identity over the entire length of the nucleotide sequence coding region which encodes (I),(II),(III) or (IV); and

(c) which has 85% identity over the entire length of a fully defined nucleotide sequence of 843 base pairs (1,2,3,4) as given in the specification;

(5) an expression vector (IX), or a recombinant live microorganism comprising (VII) or (VIII);

(6) a host cell (X), or a membrane comprising (IX) which expresses (V);

(7) preparation of (I),(II),(III) or (IV);

(8) expression of (VII) or (VIII) which comprises transforming (X) with (IX) which contains any one of the polynucleotides given above and culturing (X) under suitable conditions to express the polynucleotides;

(9) a vaccine composition which comprises (I),(II),(III) or (IV) or (V);

(10) a vaccine composition which comprises (VII) or (VIII);

(11) an antibody (Ab) immunospecific for (I),(II),(III), (IV), (V) or (VI); and

(12) diagnosing a Moraxella infection by identifying (I),(II),(III), (IV),(V) or (VI) or an Ab produced against them, present in a biological sample obtained from an animal suspected of having such infection.

ACTIVITY - Anti-inflammatory; auditory.

MECHANISM OF ACTION - Vaccine. The efficacy of BASB020 vaccine was analyzed by enhancement of lung clearance of M.catarrhalis in mice. Groups of 6 BALB/c mice were immunized subcutaneously with 100 mu l of vaccine corresponding to a 10 mu l dose and were boosted 2 weeks later. One week after the booster, the mice were challenged by instillation of 50 mu l of bacterial suspension into the left nostril under anesthesia and 0.8 mg ketamine. Mice were killed 4 hours after challenge and the lungs are removed aseptically a homogenized individually. The log 10 weighted mean number of CFU/lung is determined by counting the colonies grown on Mueller-Hinton agar plates after plating of 20 mu l of 5 serial dilutions of the homogenate. BASB020 vaccine induced significant lung clearance as compared to the control (0.62 log difference).

USE - The polynucleotides may be used as hybridization probes for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB020 and to isolate cDNA and genomic clones of other genes that have high sequence identity to BASB020 gene. The polynucleotides and polypeptides are used as research reagents and materials for discovery of treatments of and diagnostics for human diseases. The polynucleotides derived from (1,2,3,4) are used for PCR to determine whether or not the identified polynucleotides are transcribed in bacteria in infective tissue and so are helpful in the diagnosis of the stage and type of infection, the pathogen has attained. Probes comprising BASB020 nucleotide sequence can be constructed to conduct efficient screening of genetic mutations, serotype, taxonomic classification or identification. Primers with 1-4 nucleotides removed from the 5' and/or 3' end are used for amplifying BASB020 DNA and/or RNA isolated from a sample derived from an individual. The polynucleotides are used as components of high density polynucleotide arrays or grids which are useful for diagnostic and prognostic purposes. The antibodies directed against (I),(II),(III),(IV) or (VII) are employed to isolate or to identify clones expressing (I),(II),(III),(IV) or (VII) or to purify them. The polynucleotide sequences can be used in the discovery and development of antibacterial compounds. The encoded protein, for expression can be used as target for the screening of antibacterial drugs. Additionally, the polynucleotide sequences encoding the amino terminal regions of the encoded protein or Shine-Delgarno or other translation facilitating sequences of the respective mRNA can be used to construct antisense sequences to control the expression of the coding sequence of interest. The polypeptides and polynucleotides are used to block the initial physical interaction between a gram negative and/or gram positive bacteria to the mammalian host. The polynucleotides encoding certain non-variable regions of bacterial cell surface protein are used in polynucleotide constructs which are useful for genetic immunization experiments in animal models of infection with M.catarrhalis to identify protein epitopes able to provoke a prophylactic or therapeutic immune response. The therapeutic composition comprising an immunologically effective amounts of a polypeptide, (I),(II),(III),(IV) or (V); or a polynucleotide, (VII) or (VIII) is useful in the preparation of a medicament for generating an immune response in an animal. A therapeutic composition comprising an Ab directed against one or two useful for treating humans with M.catarrhalis diseases (claimed) such as sinusitis, otitis media and nosocomial infections.

AN 2000-039107 [03] WPIDS
AB WO 9958682 A UPAB: 20000118
NOVELTY - Novel BASB010 polynucleotides and polypeptides from Moraxella catarrhalis are disclosed.

DETAILED DESCRIPTION - An isolated BASB010 polypeptide (I) is new, and comprises an amino acid sequence which has at least 85% or 95% identity to, or is, the 391 (Ia), 391 (Ib) or 391 (Ic) amino acid sequences given in the specification.

INDEPENDENT CLAIMS are also included for the following:

(1) An immunogenic fragment of (I) in which the immunogenic activity is substantially the same as (Ia), (Ib) or (Ic);

(2) An isolated polynucleotide encoding (I), or a complementary nucleotide;

(3) An isolated polynucleotide (II) which comprises a sequence which has at least 85% or 95% identity to over the entire length, or is, the 1176 bp (IIa), 1176 bp (IIb) or 1176 bp (IIc) sequence given in the specification, or its complement;

(4) An isolated polynucleotide encoding (Ia)-(Ic), obtainable by screening an appropriate library under stringent hybridization conditions with a labeled probe having the sequence of (IIa), (IIb), (IIc) or a fragment thereof;

(5) An expression vector or recombinant live microorganism comprising (II), or the polynucleotides of (2) or (4);

(6) A host cell comprising the expression vector of (5), or a subcellular fraction of that cell expressing (I);

(7) A process for producing (I), comprising culturing a host cell under conditions sufficient for the production of the polypeptide, and recovering the polypeptide from the culture medium;

(8) A process for expressing (II) or the polynucleotides of (2) or (4), comprising transforming a host cell with a vector comprising at least one of these polynucleotides, and culturing the cell under conditions sufficient for expression of the polynucleotide;

(9) A vaccine composition comprising an effective amount of (I) and a pharmaceutically acceptable carrier;

(10) A vaccine composition comprising an effective amount of (II) or the polynucleotides of (2) or (4), and a pharmaceutically acceptable carrier;

(11) An antibody immunospecific for (I), or the fragment of (1);

(12) A method for diagnosing a M. catarrhalis infection, comprising identifying (I), or an antibody that is immunospecific for (I), present within a biological sample from an animal suspected of having such an infection;

(13) Use of a composition comprising an immunologically effective amount of (I) or (II) or the polynucleotides of (2) or (4) in the preparation of a medicament for use in generating an immune response in an animal; and

(14) A therapeutic composition useful in treating humans with M. catarrhalis, comprising at least one antibody directed against (I) and a pharmaceutically acceptable carrier.

ACTIVITY - Anti-bacterial, immunostimulant.

MECHANISM OF ACTION - Vaccine.

USE - The polynucleotides and polypeptides may be employed as research reagents and material for the discovery of treatments and diagnostics for diseases, particularly human diseases. They can be used for diagnosis of disease, staging of disease, or determining response of an infectious organism to drugs. The polynucleotides may be used as a source for hybridization probes, and for screening of genetic mutations, serotype, organism or strain identification, identification of mutations in BASB013 sequences, and as components of arrays which are useful for diagnostic and prognostic purposes. The polypeptides can be used to produce antibodies. The polypeptides can also be used in vaccine formulations, and to identify agonists and antagonists. The polypeptides, antibodies, agonists and antagonists (which are bacteristatic) are used for the treatment and prevention of diseases such as otitis media in infants and children, pneumonia in the elderly, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in middle ear, auditive nerve damage, delayed speech learning, infection of the upper respiratory tract and inflammation of the middle ear. They are particularly used to diagnose and treat

M. catarrhalis infections. The polypeptides, agonists and antagonists are also used for screening of antibacterial drugs.

ADVANTAGE - The frequency of Moraxella catarrhalis infections has risen dramatically, and it is no longer common to isolate M. catarrhalis strains that are resistant to standard antibiotics. The BASB010 products of the invention can be used screen for new antibacterial compounds that may target these resistant bacteria.
